Abstract - The hemerobiid fauna of Serbia was studied during two collecting trips in the years 2015 and 2016. Prior to the present study the hemerobiids in this Balkan country were insufficiently explored. According to literature data and collected material, twenty-three species are listed for the country, of which six are recorded for the first time for Serbia.

KEY WORDS: hemerobiid fauna, lacewings, Balkan Peninsula

**Izvleček - FAVNA RJAVAH MREŽEKRILCEV REPUBLIKE SRBIJE (INSECTA:
NEUROPTERA: HEMEROBIIDAE)**

Tekom dveh terenskih odprav v Srbijo smo v letih 2015 in 2016 raziskovali favno rjavih mrežekrilcev. Pred aktualno raziskavo so bili hemerobiidi tega območja zelo slabo poznani. Po analizi literaturnih podatkov in nabranega materiala predstavljamo seznam 23 vrst za Republiko Srbijo, od katerih je šest novih najdb za to balkansko državo.

KLJUČNE BESEDE: favna hemerobiidov, mrežekrilci, balkanski polotok

Introduction

Hemerobiidae is one of the largest families of the order Neuroptera. It contains more than 550 known species of small to medium sized insects, distributed all around

the world (Monserrat 1990, Oswald 1993, Aspöck et al. 2001). Brown lacewings are predaceous insects in both adult and larval stages. This is why they are suggested as potential control agents in greenhouses, field crops and orchards, where they could prey on aphids (New 1975, Stelzl 1991, Canard 2001, Devetak & Klokočovnik 2016). Although they appear to be bound to certain habitats (Monserrat & Marin 1996), like conifers or broad-leaved trees, they can produce eggs in lower aphid density because they do not rely on honeydew as a food source, which is the case in most Chrysopidae adults (Neuenschwander et al. 1975). Also, many hemerobiids have very low temperature thresholds, which could give them an advantage in using these predators in cool periods in temperate climates (Neuenschwander 1975, 1976, New 1975).

Neuropteran fauna of Serbia was poorly studied and authors report sporadic information on species occurrence in this Balkan country (Pančić 1863, Frivaldszky 1877, Biró 1885, Mocsáry 1899, Olasz 1906, Pongrácz 1914, Živojinović 1950, Petrik 1958, Grozdanić & Stevanović 1969, Aspöck et al. 1980, 2001, Mitić & Gradojević 1983, Stevanović & Bjelić 1985, Devetak 1992, Devetak & Jakšić 2003, Devetak et al. 2015, Petrović 2013, Marković et al. 2016).

Even though brown lacewings have the potential of becoming economically important group, in the past, their fauna on the Balkan Peninsula was studied very poorly and only sporadic data exist so far. Because of that, species distribution for different Balkan countries is still lacking. Popov & Letardi (2010) in their review summarizing information on the Neuroptera of the Balkan Peninsula report 44 brown lacewing species for the peninsula. However, in recent times, no information about their presence in different Balkan countries is given, except from Albania (Klokočovnik et al. 2014, Devetak & Rausch 2016). For Serbia, only a part of the country was studied, namely Kosovo and Metohija, and 15 brown lacewing species were reported for this part (Devetak & Jakšić 2003). In older literature (Mocsáry 1899, Pongrácz 1914), only two hemerobiid species were reported in Vojvodina.

In July 2015 and June 2016, zoologists from the Department of Biology of the University of Maribor (Slovenia) organized two neuropterological collecting trips to different parts of Serbia. In 2015 neuropterans were collected in south-eastern and western Serbia, with special focus on the Pirot district with foothills of the Stara planina mountain and the Tara National Park, while in 2016 in the north-eastern and in south-eastern part of the country – in the Deliblato sands and the Stara planina mountain. The aim of this paper is to present new faunistical data on the basis of those recent field trips, and to compile literature records.

Material and methods

The survey of brown lacewings was carried out during two collecting trips in the years 2015 and 2016. Additionally, some material was obtained from previous collecting trips not focused on Hemerobiidae. Also, literature data is presented.

During the collecting trips, animals were collected using an insect net. Collected specimens were preserved in ethanol and deposited in the last author's collection. Nomenclature and taxonomy has been used in accordance with Oswald (2017). We

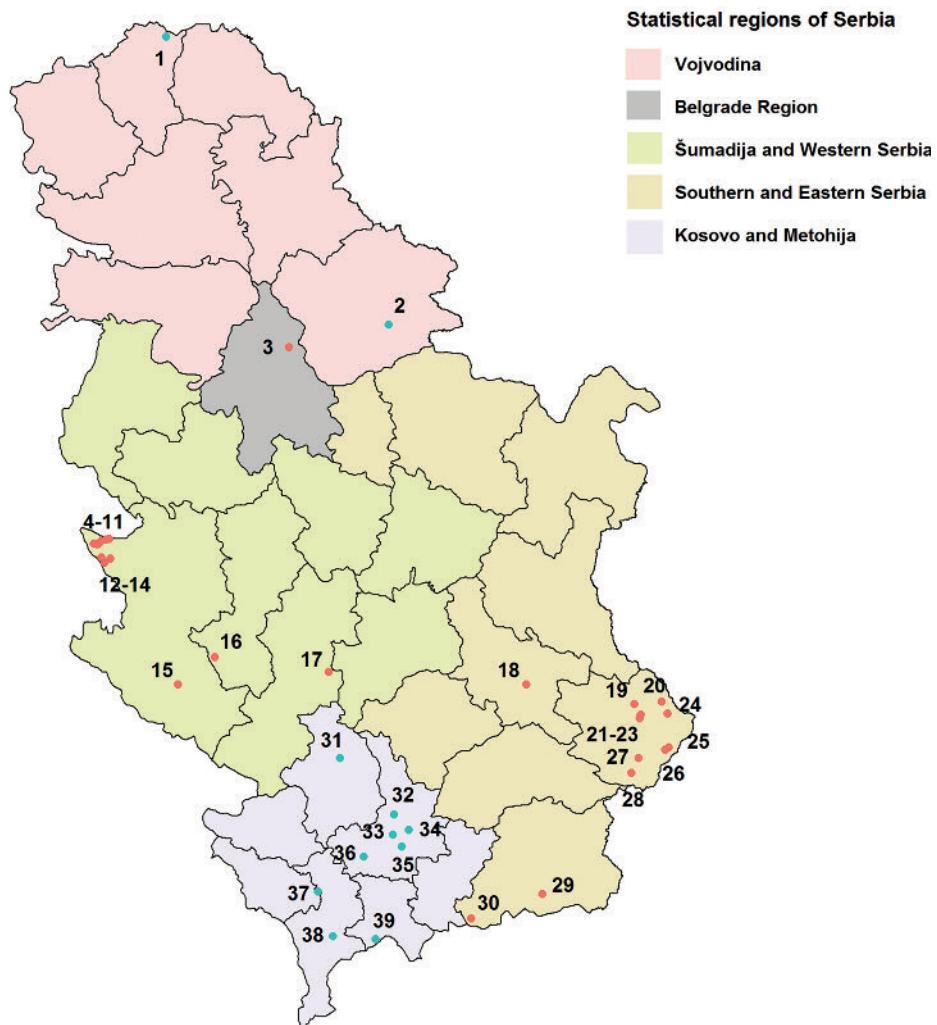

Fig. 1: Statistical regions of Serbia with collection sites of collected material (red dots) and literature records (blue dots) (collection sites with numbers are listed in material and methods).

followed zoogeographical categorization of Neuropterid fauna of the Balkan Peninsula proposed by Aspöck et al. (2001) and Popov & Letardi (2010). The map of Serbia was created with ggmap and ggplot2 packages for R Statistics (Kahle & Wickham 2013).

Most of the material was collected in the periods 21-28 June 2015 and 3-10 July 2016. Thirty-nine collecting sites were included in the survey (with details of geographic position, altitude, and type of the habitat, where information was available) (Tab. 1, Fig. 1).

Results

A total of 23 hemerobiid species were found. They belong to 6 subfamilies and 7 genera. The list of species with data about the localities is given below.

Hemerobiidae Latreille, 1802

Hemerobiinae Latreille, 1802

Hemerobius humulinus Linnaeus, 1758

Literature records:

Kosovo and Metohija: 32, 33, 34, 36 (Devetak & Jakšić 2003)

Material:

Belgrade Region: 3

Šumadija and Western Serbia: 4, 5, 6, 7, 8, 9, 10, 11, 12

Southern and Eastern Serbia: 20, 24, 27, 28

Zoogeographical element: Holarctic.

Hemerobius simulans Walker, 1853

Literature records:

Kosovo and Metohija: 33 (Devetak & Jakšić 2003)

Material:

Southern and Eastern Serbia: 22

Zoogeographical element: Holarctic.

Hemerobius stigma Stephens, 1836

Literature records:

Kosovo and Metohija: 33 (Devetak & Jakšić 2003)

Zoogeographical element: Holarctic.

Hemerobius pini Stephens, 1836

Material:

Šumadija and Western Serbia: 11

First record for Serbia.

Zoogeographical element: Siberian.

Hemerobius contumax Tjeder, 1932

Material:

Šumadija and Western Serbia: 16

First record for Serbia.

Zoogeographical element: Central European–Mediterranean.

Hemerobius handschini Tjeder, 1957

Literature records:

Kosovo and Metohija: 33 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 4, 5, 7, 10, 12, 13

Southern and Eastern Serbia: 21, 24, 25, 26, 29

Zoogeographical element: Holomediterranean (expansive northwards).

Hemerobius micans Olivier, 1793

Literature records:

Kosovo and Metohija: 32, 33, 34, 35, 36, 37 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 4, 5, 6, 7, 9, 10, 11, 13, 14, 15

Southern and Eastern Serbia: 20, 24, 27, 28, 29

Zoogeographical element: Holomediterranean (expansive northwards).

Hemerobius lutescens Fabricius, 1793

Literature records:

Kosovo and Metohija: 32, 33, 34 (Devetak & Jakšić 2003)

Zoogeographical element: Siberian.

Hemerobius gilvus Stein, 1863

Literature records:

Kosovo and Metohija: 33, 35 (Devetak & Jakšić 2003)

Material:

Southern and Eastern Serbia: 28, 29

Zoogeographical element: Holomediterranean (expansive northwards).

Hemerobius marginatus Stephens, 1836

Literature records:

Kosovo and Metohija: 33, 34, 36 (Devetak & Jakšić 2003)

Zoogeographical element: Siberian.

Wesmaelius quadrifasciatus (Reuter, 1894)

Material:

Šumadija and Western Serbia: 16

First record for Serbia.

Zoogeographical element: Siberian.

Wesmaelius subnebulosus (Stephens, 1836)

Literature records:

Kosovo and Metohija: 32, 33, 34, 36 (Devetak & Jakšić 2003)

Zoogeographical element: Holomediterranean (expansive northwards).

Sympherobiinae Comstock, 1918

Sympherobius pygmaeus (Rambur, 1842)

Literature records:

Kosovo and Metohija: 33 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 15

Southern and Eastern Serbia: 29, 30

Zoogeographical element: Holomediterranean (expansive northwards).

***Sympherobius elegans* (Stephens, 1836)**

Literature record:

Vojvodina: 2 (Mocsáry 1899, Pongrácz 1914)

Zoogeographical element: Holomediterranean (expansive northwards).

***Sympherobius fuscescens* (Wallengren, 1863)**

Material:

Šumadija and Western Serbia: 13

First record for Serbia.

Zoogeographical element: Siberian.

Notiobiellinae Nakahara, 1960

***Psectra diptera* (Burmeister, 1839)**

Literature records:

Vojvodina: 1 (Mocsáry 1899, Pongrácz 1914)

Zoogeographical element: Holarctic.

Megalominae Krüger, 1922

***Megalomus tortricoides* Rambur, 1842**

Literature records:

Kosovo and Metohija: 31, 32, 34 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 11, 16

Southern and Eastern Serbia: 19, 22, 23, 30

Zoogeographical element: Holomediterranean (expansive northwards).

***Megalomus tineoides* Rambur, 1842**

Material:

Southern and Eastern Serbia: 30

First record for Serbia.

Zoogeographical element: Holomediterranean (stationary).

Drepanepteryginae Krüger, 1922

***Drepanepteryx phalaenoides* (Linnaeus, 1758)**

Literature records:

Kosovo and Metohija: 34 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 17

Zoogeographical element: Siberian.

Microminae Krüger, 1922

Micromus variegatus (Fabricius, 1793)

Literature records:

Kosovo and Metohija: 31 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 16

Southern and Eastern Serbia: 18, 22, 30

Zoogeographical element: Siberian.

Micromus angulatus (Stephens, 1836)

Literature records:

Kosovo and Metohija: 38 (Devetak & Jakšić 2003)

Material:

Šumadija and Western Serbia: 4, 10, 15, 16

Zoogeographical element: Holarctic.

Micromus paganus (Linnaeus, 1767)

Literature records:

Kosovo and Metohija: 39 (Devetak & Jakšić 2003)

Zoogeographical element: Siberian.

Micromus lanosus (Zelený, 1962)

Material:

Šumadija and Western Serbia: 4, 8, 11, 16

Southern and Eastern Serbia: 27, 30

First record for Serbia.

Zoogeographical element: Central European.

Discussion

In our collecting trips 16 species of the Hemerobiidae family were found, six of them are new records for Serbian fauna. Together with scarce literature data, a list, with total number of 23 brown lacewing species for Serbia, is presented.

The most common species belong to the genus *Hemerobius*. Species *H. humulinus*, *H. handschini* and *H. micans* were found in high abundance and in most of visited localities. Other species, however, were not so abundant and present only locally. Two species, *Symploce elegans* and *Psectra diptera* are known only from old literature records (Mocsáry 1899, Pongrácz 1914) and were not found within our collecting trips.

The zoogeographical distribution of the brown lacewing species recorded in Serbia may be summarized as follows: eight species are Holomediterranean (7 expansive northwards and 1 stationary), 5 species are Holarctic (Siberian-Nearctic), 8 species

are Euro-Siberian (Siberian), one species is Central European-Mediterranean and one Central European.

The brown lacewing fauna of Serbia is far from being well explored, and further investigations should be carried out to improve our knowledge of the biodiversity and especially species distribution of the family in this country. Few species are still expected in the region.

Acknowledgements

We are grateful to the Ministry of Agriculture and Environmental Protection of the Republic of Serbia for the permission to collect insects. This research was supported partly by the Research Project Biodiversity of the green lacewings (Neuroptera: Chrysopidae) in Serbia – bilateral research Slovenia – Serbia (RP BioDiv CHRYSER 2015) and by the Slovenian Research Agency and the Research Programme Computationally Intensive Complex Systems (P1-0403).
