RAZISKOVANJE POSELITVENIH VZORCEV IN 'MREŽENJE' V PROSTORU

POVZETEK

Številne študije o stanju in trendih prostorskega razvoja nudijo podporo razvoju politik v smeri uresničevanja ciljev teritorialne kohezije in skladnega razvoja ozemlja Evrope. Po drugi strani pa se v prostoru srečujemo z vprašanji vpliva globalizacije, socialnih in demografskih sprememb, ki nenadzorovano spreminjajo želje in potrebe prebivalcev in obiskovalcev. Zato je tudi v raziskovanju vse večji poudarek na oblikovanju scenarijev prostočasnih dejavnosti, rekreacije in turizma ter možnostih prilagajanja teh programov vse bolj spreminjačemu povpraševanju. Vedno bolj se opušča tradicionalna organizacija poselitvene strukture na podeželju, ki se prilagaja sodobnemu načinu življenja, drugačnim poselitvenim strukturam, družbenim in demografskim spremembam [Mrak et al., 2013]. Prostorski posegi so vse bolj usmerjeni v trajnostno naravnane, bolj etične in odgovorne koncepte, ki ne vključujejo samo vprašanja varovanja okolja, ampak tudi kulturne, ekonomske in politične vidike trajnosti.

Raziskovanje in razumevanje raznolikosti poselitvenih vzorcev (slika 2) za nadaljnji razvoj, s poudarkom na trajnosti razvoja, je proces, ki se ne osredotoča samo na gospodarski razvoj, temveč vključuje uravnotežen ekološki in družbeno-socialni razvoj. Izpostavljena je misel, da sodobna družba gradi na občutku za skupnost in skupne dolžnosti, torej socialni kapital kot 'življenjskost' družbe danes. Pri zagotavljanju socialne vzdržnosti (več zaupanja in sodelovanja, manj neenakosti) ne gre le za zagotavljanje, da se ohranja sedanja oblika, temveč se zagotavlja stalno izboljšanje tudi z gradnjo novih oblik skupnosti. Le ob zavedanju vsestranskih vplivov med človekom, tehnologijo, grajenim okoljem in naravnimi potenciali, z dobrim poznanjem vseh dejavnikov in aktivnim delovanjem, je mogoče graditi kakovostno bivalno okolje ter obenem upoštevati načela trajnostnega razvoja [Čok et al., 2013]. Zato iskanje

RESEARCHING SETTLEMENT PATTERNS AND SPATIAL 'NETWORKING'

SUMMARY

Policy development towards the realization of the objectives of territorial cohesion and coherent development of the European territory is supported by many studies exploring the situation and trends of spatial development. On the other hand, we are confronted with the impacts of globalisation, social, and demographic changes that uncontrollably affect the desires and needs of inhabitants and visitors. Hence, research, too, should devote more attention to scenario building related to leisure activities, recreation and tourism, and the possibility of adapting these programmes to the increasingly changing demands. The traditional settlement structure organisation in rural areas is increasingly being abandoned; it is adapting to the contemporary way of live, different settlement structures, social and demographic changes [Mrak et al., 2013]. Spatial interventions are increasingly focused on sustainable and ethical concepts, and concepts of accountability that address not only environmental protection, but also cultural, economic and political aspects of sustainability.

Research and understanding of the diversity of settlement patterns (figure 2) for further development, with an emphasis on sustainable development, is a process that focuses not only on economic development, but it also includes balanced ecological and social development. Notably, the modern society builds on the sense of community and collective duty, i.e. social capital as the 'vitality' of the society today. Ensuring social sustainability (more trust and participation, less inequality) is thus not only a matter of ensuring that the current situation is preserved, but to continuously provide improvements, also by building new types of community. It is only by acknowledging the different interactions between man, technology, the built environment and natural potentials, with good knowledge of all factors and action, that we can build a good quality living environment, and consider the principles of sustainable development at the same time [Čok et al., 2013].

koncepta stavbe zahteva celovito obravnavo sistema stavbe, njenih interakcij z okoljem in uporabnikom. Glede na velik delež in kakovost obstoječega stavbnega fonda mora koncept stavbe naslavljati novogradnje in obstoječe stavbe oziroma njihove prenove. Potreba po razvoju koncepta stavbe izhaja tudi iz nujnosti prilaganja na podnebne spremembe in spremljajoče pojave ter probleme, povezane z njimi.

UPORABNOST REZULTATOV

Ob raziskovanju sodobnih prostorskih konceptov smo ugotovljali, da je na ravni načrtovanja širšega prostora možna vzpostavitev sistemov 'mreženja', ki ne slonijo več na klasični morfologiji in tipologiji vzorcev. Kot aplikativni primer navajamo idejo o nujni nadgradnji obstoječega sistema gorske arhitekture in vzpostavitev povezanosti med posameznimi točkami poselitvenih vzorcev z umestitvijo centralne enote [Čerpes et al., 2014].

KLJUČNE BESEDE

prostočasne dejavnosti, poselitveni vzorec, trajnostni razvoj, bivalno okolje, stavba

In order to find a rethink the concept of the building we should first comprehensively examine the system of the building, and its interactions with the environment and users. With regard to the high proportion and quality of the existing building stock, the concept of the building must address both new buildings and the existing ones, or their renovations. The need to develop the concept of the building emerges from the necessity to adapt to climate change and associated phenomena, and the problems related to these changes.

ISSUES AND THEIR SIGNIFICANCE

While researching contemporary spatial concepts we found that in the context of broader spatial planning, it is possible to set up 'networking' systems that are no longer based on conventional morphology and pattern typology. An example of application is the idea about the necessary upgrade of the existing system of alpine architecture, thus providing connectivity between the individual points of settlement patterns, along with introducing a central unit in the system [Čerpes et al., 2014].
