

TWO NEW TALL HERB COMMUNITIES WITH THE DOMINANT *LASERPITIUM SILER* AND *GRAFIA GOLAKA* FROM THE SE ALPS (NE ITALY, W SLOVENIA)

Igor DAKSKOBLER¹ & Livio POLDINI²

Abstract

The article describes two new tall herb communities in the Southeastern Alps, *Centaureo julici-Laserpitietum sileris* and *Laserpitio sileri-Grafietum golakae*. Both are long-term successional stages in the overgrowing of abandoned hay meadows in the altimontane and subalpine belt of the southern and southwestern Julian Alps (including the Julian Prealps), partly also the Carnic Alps, that have been abandoned for over 50 years. In the succession sere where the altimontane-subalpine Illyrian beech forest (*Dentario pentaphylli-Fagetum*, *Ranunculo platanifoli-Fagetum*, *Polysticho lonchitis-Fagetum*) is the potential natural vegetation on steep, sunny limestone (rarely dolomite) slopes, the species *Laserpitium siler* and (or) *Grafia golaka* act as inhibitors also due to their high allelopathic potential; in turn, spontaneous afforestation with spruce and some deciduous trees has been slow and gradual.

Key words: *Laserpitium siler*, *Grafia golaka*, synsystematics, syndynamics, the Julian Alps, the Carnic Alps, Slovenia, Italy, Natura 2000.

Izvleček

Opisujemo dve novi združbi visokih steblik v Jugovzhodnih Alpah, *Centaureo julici-Laserpitietum sileris* in *Laserpitio sileri-Grafietum golakae*. Obe sta dolgotrajeni sukcesijski stadiji pri zaraščanju nekdanjih in že več kot 50 let opuščenih senožetih v altimontanskem in subalpinskem pasu južnih in jugozahodnih Julijskih Alp (vključno z Julijskimi Predalpami) in deloma tudi Karnijskih Alp. V sukcesijskem nizu, v katerem je potencialno naravna vegetacija na strmih prisojnih apnenčastih (redkeje dolomitnih) pobočjih altimontansko-subalpinski ilirski bukov gozd (*Dentario pentaphylli-Fagetum*, *Ranunculo platanifoli-Fagetum*, *Polysticho lonchitis-Fagetum*), vrsti *Laserpitium siler* in (ali) *Grafia golaka* tudi zaradi svojega močnega alelopatskega potenciala delujejo in je zato zaraščanje s smreko in nekaterimi listavci počasno in postopno.

Ključne besede: *Laserpitium siler*, *Grafia golaka*, sinsistematička, sindinamika, Julijiske Alpe, Karnijske Alpe, Slovenija, Italija, Natura 2000.

1. INTRODUCTION

Several years ago (Dakskobler 2003), we studied forest development on abandoned hay meadows in the southern Julian Alps. These hay meadows were cleared in the belt of the subalpine beech forest classified into the association *Polysticho lonchitis-Fagetum* and are gradually becoming overgrown, especially with spruce. Based on the floristic-phytosociological analysis of 23 relevés the

species-rich former hay-meadows were classified into the southeastern-Alpine alliance *Caricion austroalpinae* Sutter 1962 and, being a relatively long-term successional stage, described as a provisional new association *Centaureo julici-Laserpitietum sileris* nom. prov. Subsequent research conducted in the various parts of the Julian Alps (the upper Bača Valley, the Breginjski Stol ridge, the valleys of Bala and Loška Koritnica) confirmed our decision for an independent association as

¹ Institute of Biology, Scientific Research Centre of the Slovenian Academy of Sciences and Arts, Regional unit Tolmin, Brunov drevored 13, SI-5220 Tolmin, Igor.Dakskobler@zrc-sazu.si

these stands form a physiognomically (in their appearance) and floristically distinct community that can be spatially delimited and is relatively long-standing due to the slow rate of spontaneous afforestation. Latest research (comp. Kaligarič et al. 2011) has shown a strong allelopathic potential of *Laserpitium siler*, which in addition to other factors (snowslides) inhibits successional development back towards forest. A brief report on similar fringe communities from the Italian part of the Julian Alps and the Carnic Alps was published several years ago (Poldini 2003). A comparison of the collected relevé material from the whole region (W Slovenia and NE Italy) facilitated the typification of two new associations, *Centaureo julici-Laserpitietum sileris* and *Laserpitio sileri-Grafiagetum golakae*.

2. METHODS

We inventoried the abandoned grasslands in the upper montane and subalpine belt (900 to 1900 m a.s.l.) in the western, southern and southwestern part of the Julian Alps (Figure 1) and partly also

in the Carnic Alps. Phytosociological records were made according to the standard Central-European phytosociological method (Braun-Blanquet 1964) and entered into the FloVegSi database (Seliškar et al. 1993). Relevés from the Slovenian part of the Julian Alps (some of which have already been published as a separate subassociation *Centaureo julici-Laserpitietum sileris asphodelotum albi* nom. prov. – Dakskobler et al. 2007) were combined with the relevés of slightly similar stands in NE Italy: the Carnic Alps: M. Chiadin – Sappada, M. Talm, the western Julian Alps: Val Raccollana, the Julian Prealps: Mt. Matajur, the Stol ridge / Gran Monte: Punta Lausciovizza / Lanževica; M. Cuarnan / Mali Karman, the Muzci ridge / Cime del Monte Musi: M. Cadin. Combined cover-abundance values were transformed into numerical values (1–9) according to van der Maarel (1979). Numerical comparisons were performed with the SYN-TAX 2000 program package (Podani 2001). The relevés were compared by means of “(unweighted) average linkage method” – UPGMA, “Incremental sum of squares method” – MISSQ and principal coordinates analysis (PCoA). Wishart’s similarity

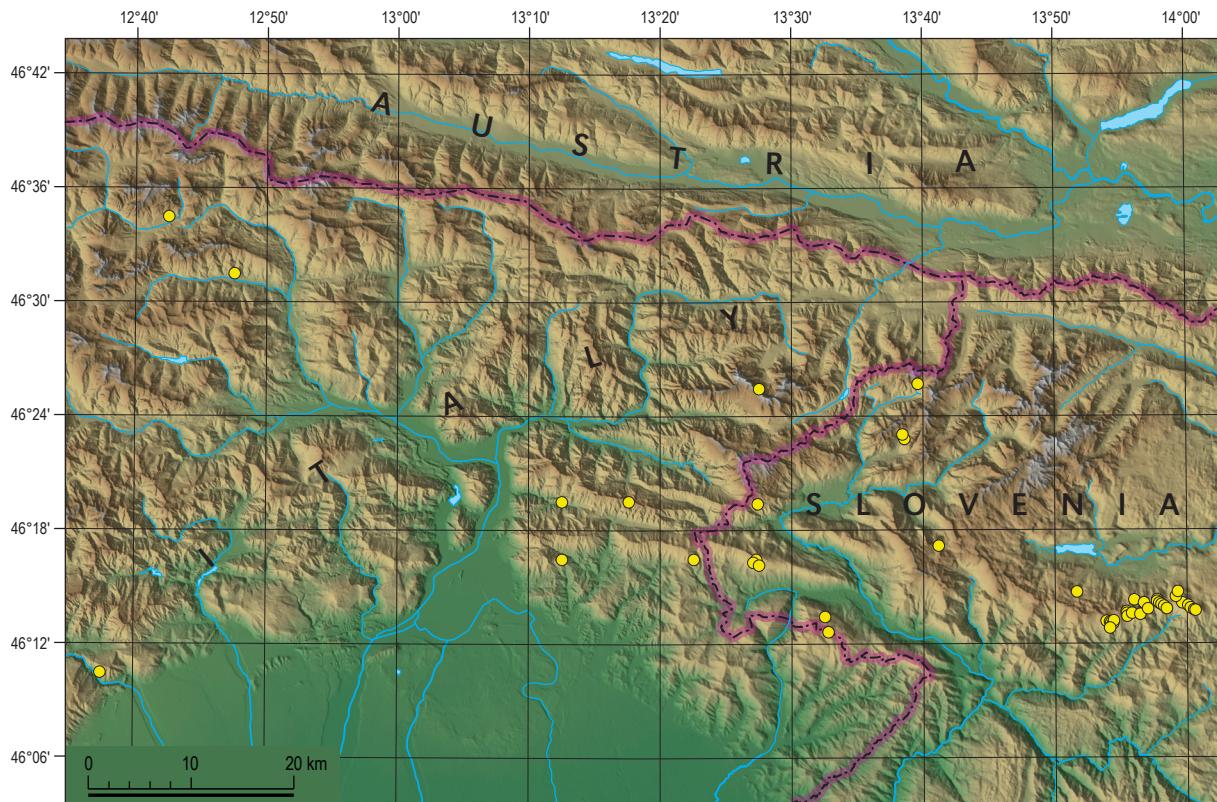

Figure 1: Research area with approximate localities of relevés in scale 1: 500 000 (Map source: Jarvis & al. 2008).

ratio was used in all of the methods. The nomenclature source for the names of vascular plants is the Mala flora Slovenije (Martinčič et al. 2007) – except for the taxa *Knautia ressmannii* (Pacher) Briq. and *Bupleurum ranunculoides* subsp. *caricinum* (DC.) Arcang. – and Martinčič (2003) for the names of mosses. The nomenclature of the syntaxa follows Šilc & Čarni (2012). In the classification of species into phytosociological groups (groups of diagnostic species) we mainly refer to the Flora alpina (Aeschimann et al. 2004 a, b, c). Coordinates of relevés are determined according to the Slovenian geographic coordinate system D 48 (5th zone) on the Bessel ellipsoid and with Gauss-Krüger projection.

3. ECOLOGICAL DESCRIPTION OF THE STUDY AREA

The predominant geological bedrock in the research area is limestone, in places admixed with marlstone and chert, rarely with dolomite. The soils are shallow fresh rendzinas, very rarely brown soils. Potential natural vegetation of the researched part of the Julian Alps is mainly beech forest classified into the associations *Ranunculo platanifolii-Fagetum*, *Dentario pentaphylli-Fagetum* and *Polysticho lonchitis-Fagetum*; the grasslands above the upper timberline are classified into the associations *Avenastro parlatorei-Festucetum calvae* and *Ranunculo hybridi-Caricetum sempervirentis*. The climate is relatively warm and very humid and mean annual precipitation usually exceeds 2500 mm. The slopes are mainly sunny and open to the influence of the Adriatic Sea (for more information on the climate of the study area see Dakskobler 2003, Čušin 2006, Gobbo & Poldini 2005).

4. RESULTS AND DISCUSSION

Firstly, we compared 87 relevés of stands with dominant *Laserpitium siler* and (or) *Grafia golaka* in the Julian Alps and their foothills (the so-called Julian Prealps) and the Carnic Alps – Figures 2 and 3. Stands with the dominant *Grafia golaka* from the Julian Prealps (Mt. Matajur, the Stol ridge / Gran Monte and the Muzci ridge / Cime del Monte Musi) clearly separated from the stands with the dominant *Laserpitium siler* from the western and southern Julian Alps and the Carnic Alps. Four main groups in the den-

drogram (Figure 2) were interpreted as: 1 *Centaureo julici-Laserpitietum sileris typicum*, 2 *Centaureo julici-Laserpitietum sileris* var. geogr. *Pedicularis elongata*, 3 *Centaureo julici-Laserpitietum sileris asphodeletosum albi* and 4 *Laserpitio sileri-Grafietum golakae*. Two-dimensional scatter-diagram (Figure 3) on the first axis partly indicates the phyto-geographical gradient and on the second axis the altitudinal gradient. This comparison formed the basis for the analytic tables (Tables 1, 2, 3, 4). The first table comprises typical stands of the association *Centaureo julici-Laserpitietum sileris*, Table 2 encompasses fringe stands of this association which indicate possible transitions to similar tall herb and mountain grassland communities (for the time being treated as a variant *Centaureo julici-Laserpitietum sileris typicum* var. *Brachypodium rupestre*), the third table comprises subalpine stands with the dominant *Laserpitium siler* from NE Italy (*Centaureo julici-Laserpitietum sileris* var. geogr. *Pedicularis elongata*) and the fourth table the stands with the dominant *Grafia golaka* (*Laserpitio sileri-Grafietum golakae*).

The second step was to make a synoptic table (Table 5) into which we classified the above four syntaxa, the relevés of the subassociation *Centaureo julici-Laserpitietum sileris asphodeletosum albi* nom. prov. (Dakskobler et al. 2007, Tab. 1, relevés 8–33) and two similar fringe communities from central and southeastern Slovenia: *Scabioso hladnikiana-Grafietum golakae* Čarni 2007 from the Polhov Gradec Hills (Čarni 2007) and *Laserpitietum sileris* Springer 1987 var. geogr. *Dianthus crotatus* from the Gorjanci hills (Čarni et al. 2005). Some of the communities with the dominant *Laserpitium siler*, e.g. *Carici humilis-Centaureetum rupestris* Ht. 1931 *laserpitietosum sileris* Kaligarič & Poldini 1997 (Kaligarič 1997, Kaligarič & Poldini 1997), *Libanotido-Laserpitietum sileris* van Gils et al. 1975 (van Gils et al. 1975, Čarni 1997), *Laserpitio-Festucetum alpestris* Pedrotti 1970 (Pedrotti 1970), *Origano-Calamagrostietum variae* Lippert ex Thiele 1978 (Grabherr et al. 1993: 431–433) and *Laserpitio-Seslerietum* Moor 1957 (Oberdorfer 1978, Ewald 1996), were not included in our comparison as they are either communities of a different altitudinal belt (submontane, lower montane) and (or) communities of a phytogeographically entirely different environment and subsequently clearly floristically different.

Some of the species common to all of the compared communities are *Laserpitium siler*, *L. latifolium*, *Polygonatum odoratum*, *Silene nutans* s. lat.,

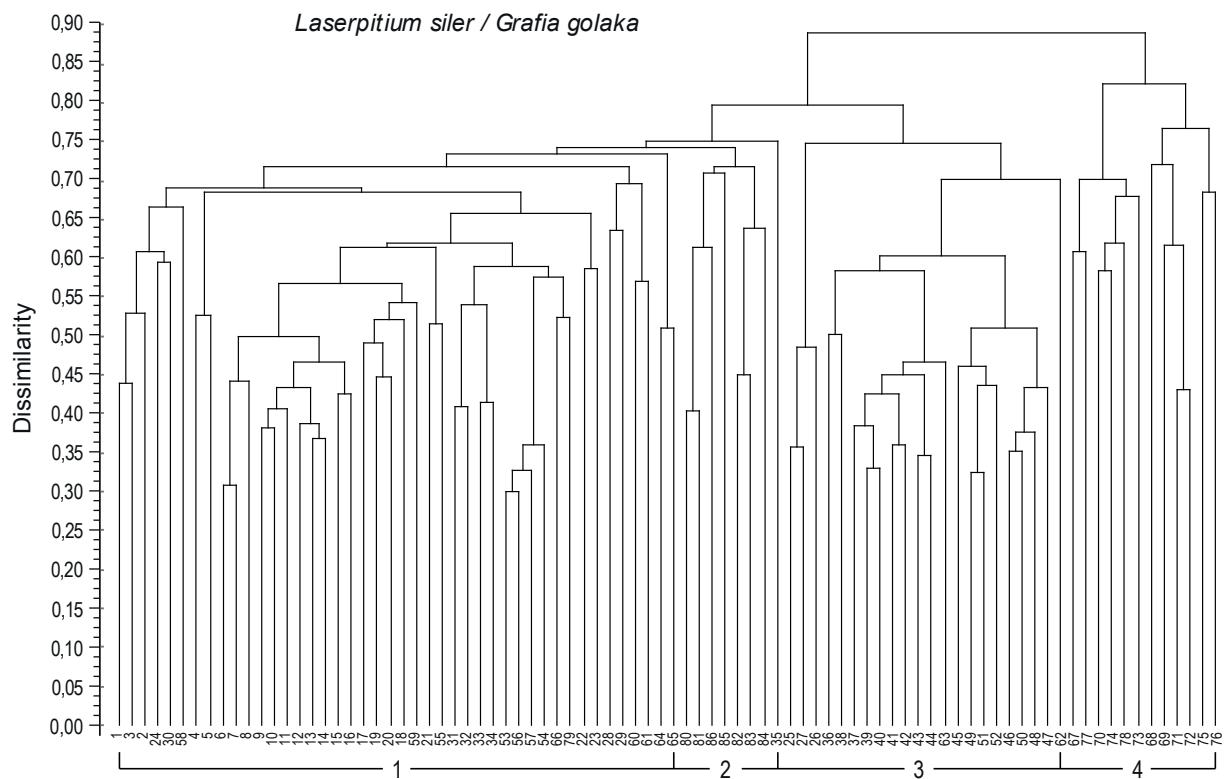

Figure 2: Dendrogram of tall herb communities with dominant *Laserpitium siler* or *Grafia golaka* in the Julian and Carnic Alps (NE Italy, W Slovenia) – UPGMA, similarity ratio (1 *Centaureo julici-Laserpitietum sileris typicum*, 2 *Centaureo julici-Laserpitietum sileris* var. geogr. *Pedicularis elongata*, 3 *Centaureo julici-Laserpitietum sileris asphodeletosum albi*, 4 *Laserpitio sileri-Grafietum golakae*).

Slika 2: Dendrogram združb visokih steblik z dominantnima vrstama *Laserpitium siler* ali *Grafia golaka* v Julijskih in Karnijskih Alpah (severovzhodna Italija, zahodna Slovenija) – UPGMA, similarity ratio (1 *Centaureo julici-Laserpitietum sileris typicum*, 2 *Centaureo julici-Laserpitietum sileris* var. geogr. *Pedicularis elongata*, 3 *Centaureo julici-Laserpitietum sileris asphodeletosum albi*, 4 *Laserpitio sileri-Grafietum golakae*).

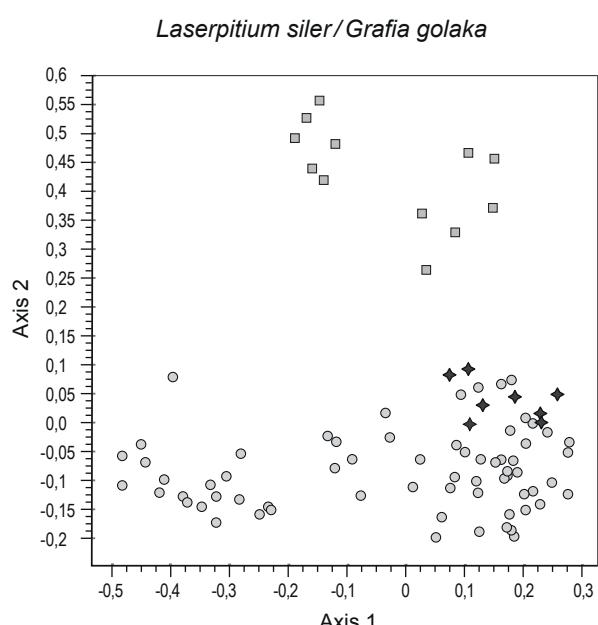

Figure 3: Two-dimensional scatter-diagram of tall herb communities with dominant *Laserpitium siler* or *Grafia golaka* in the Julian and Carnic Alps (NE Italy and W Slovenia) – PCoA, similarity ratio (○ – *Centaureo julici-Laserpitietum sileris* – W Slovenia, ◆ – *Centaureo julici-Laserpitietum sileris* – NE Italy, ■ – *Laserpitio sileri-Grafietum golakae*).

Slika 3: Dvorazsnežni ordinacijski diagram združb visokih steblik z dominantnima vrstama *Laserpitium siler* ali *Grafia golaka* v Julijskih in Karnijskih Alpah (severovzhodna Italija, zahodna Slovenija) – PCoA, similarity ratio (○ – *Centaureo julici-Laserpitietum sileris* – zahodna Slovenija, ◆ – *Centaureo julici-Laserpitietum sileris* – severovzhodna Italija, ■ – *Laserpitio sileri-Grafietum golakae*).

Buphthalmum salicifolium, *Koeleria pyramidata* s. lat., *Cirsium erisithales*, *Carlina acaulis* s. lat. and *Centaurea triumfettii*. Differential species of the first main cluster are *Bromopsis transsilvanica*, *Laserpitium peucedanoides* and *Festuca calva*. Differential species of the second main cluster are *Scabiosa hladnikiana*, *Tephroseris longifolia*, *Prunella vulgaris*, *Mercurialis ovata*, *Betonica officinalis*, *Salvia pratensis* and *Euphorbia verrucosa*. Differential species of the first four syntaxa (*Centaureo julici-Laserpitietum sileris* s. lat.) are *Gentiana lutea* subsp. *sympyandra*, *Serratula tinctoria* subsp. *macrocephala*, *Prunella grandiflora*, for the typical geographical variant also *Arabis pauciflora*. Comparison of the syntaxa from the synthetic table (Table 5) clearly demonstrates that these are different communities (Fig-

ures 4 and 5). Stands of the association *Centaureo julici-Laserpitietum sileris* are distinctly different from the stands of the association *Laserpitietum sileris* and the stands of the association *Laserpitio sileri-Grafietum golakae* differ from the stands of the association *Scabioso hladnikianae-Grafietum golakae*. The differences are due to a different altitudinal belt and different potential natural vegetation. In terms of the association *Laserpitietum sileris* on the Gorjanci hills potential natural vegetation consists of submontane-montane beech forests from the associations *Hacquetio-Fagetum*, *Arunco-Fagetum* and *Cardamino savensi-Fagetum*; the stands of the association *Scabioso hladnikianae-Grafietum golakae* occur on the fringes of forest communities from the associations *Ostryo-Fagetum*, *Arunco-*

Fagetum and *Querco-Ostryetum*; contact meadow communities (*Scabioso hladnikianae-Caricetum humilis*) are classified into the alliance *Bromion erecti*. Significant differences are demonstrated also by the comparison of the composition according to phytosociological groups (groups of diagnostic species) – Table 6. Stands of the typical form of the association *Centaureo julici-Laserpitietum sileris* are dominated by the species of subalpine-alpine grasslands and swards (*Caricion austroalpinae*, *Elyno-Seslerietea*), followed by the species from classes *Festuco-Brometea* and *Trifolio-Geranietea*. Stands of the subassociation *Centaureo julici-Laserpitietum sileris asphodeletosum albi* already have a predominant proportion of the species of classes *Festuco-Brometea* and *Trifolio-Geranietea*. Subalpine stands with the dominant *Laserpitium siler* from the Carnic Alps and the western Julian Alps are very similar to other stands of the association *Centaureo julici-Laserpitietum sileris* from the southern and southwestern Julian Alps (see Figures 2, 3, 4 and 5); however, *Centaurea haynaldii* subsp. *julica* was not recorded there. These stands have a relatively large proportion of *Erico-Pinetea* species, indicating dolomite bedrock. The dominating species in the stands of the association *Laserpitio sili-Grafietum golakae* are those of the class *Festuco-Brometea*, followed by the species of the classes *Mulgedio-Aconitetea* and *Trifolio-Geranietea*. Stands of the associations *Scabioso-Grafietum* and *Laserpitietum sileris* are clearly dominated by the species of the class *Festuco-Brometea*, followed by those from the class *Trifolio-Geranietea*. There is also a large proportion of the species of the class *Erico-Pinetea*, at least in the stands of the association *Scabios-Grafietum*. Čarni (2005, 2007) classifies the associations *Scabioso-Grafietum* and *Laserpitietum sileris* into the class *Trifolio-Geranietea*, order *Origanetalia vulgaris*, alliance *Geranion sanguinei* and suballiance *Geranienion sanguinei*. In our opinion, the proportion and abundance of diagnostic species of subalpine grasslands in the stands of the association *Centaureo julici-Laserpitietum sileris* is still considerable enough for this association to be classified into the alliance *Caricion austroalpinae* and class *Elyno-Seslerietea*. Preserved grasslands that are still mown are rare in this altitudinal belt and their floristic composition features relatively equal proportions of species from the classes *Elyno-Seslerietea* and *Festuco-Brometea*. This classification is somewhat questionable only for the stands in the lower altitudinal belt of their distribution, at 1100 to 1300 m a.s.l. (subassociation *Centaureo*

julici-Laserpitietum sileris asphodeletosum albi); alternatively, they could also be classified into the class *Trifolio-Geranietea*. In our opinion, classification of the association *Laserpitio sili-Grafietum golakae* into higher syntaxonomic units should be subject to the consideration of phytosociological affinity of *Grafia golaka*. According to Poldini (1991: 399) *Grafia golaka* is a species of montane pastures, while Aeschimann et al. (2004 a: 1104) consider it a diagnostic species of the alliance *Calamagrostion arundinaceae* Oberdorfer 1950, i.e. a character species of thermo-hygrophilous montane-subalpine tall herb communities of the class *Mulgedio-Aconitetea*. Wraber (1990: 93) mentions its frequent occurrence on secondary montane pastures under the ridge of Breginjski Stol and in forest fringe communities in the belt of black hornbeam and flowering ash, as well as in the beech belt. Under the Stol and Muzci ridges *Grafia golaka* often thrives also in subalpine beech stands from the association *Polystricho lonchitis-Fagetum*. On its classic locality under Golaki *Grafia golaka* grows on very stony sites in natural clearings and in shrub stands with dominant *Salix appendiculata* and *Rhododendron hirsutum* (*Rhododendro hirsuti-Salicetum appendiculatae* nom. prov.) in the belt of subalpine beech forest (*Polystricho lonchitis-Fagetum*) – Table 7. *Grafia golaka* is therefore diagnostic for the tall herb communities from the class *Mulgedio-Aconitetea* and for the forest fringe communities from the class *Trifolio-Geranietea*. In our case, *Laserpitio sili-Grafietum golakae* is a montane-subalpine community, so a more appropriate classification would be into the class *Mulgedio-Aconitetea* and into the alliance *Calamagrostion arundinaceae*.

Systematic classification and typification of the described new syntaxa is the following:

Elyno-Seslerietea Br.-Bl. 1948

Seslerietalia albicans Br.-Bl. in Br.-Bl. & Jenny 1926 corr. Oberd. 1983

Caricion austroalpinae Sutter 1962

Centaureo julici-Laserpitietum sileris Dakskobler in Dakskobler & Poldini ass. nov. hoc loco

The nomenclatural type, *holotypus*, is relevé No. 13 in Table 1.

Diagnostic species of the association: *Laserpitium siler*, *L. latifolium* (dominant

species of the community), *Serratula tinctoria* subsp. *macrocephala* (= *S. tinctoria* subsp. *monticola*), *Lilium carniolicum*, *Gentiana lutea* subsp. *symphiandra*, *Carduus crassifolius*, *Centaurea haynaldii* subsp. *julica* (= *C. jacea* subsp. *julica* = *C. julica*) and *Laserpitium peucedanoides* (with their mainly eastern-Alpine or southeastern-Alpine-Ilyrian distribution the last five species characterize the new association also phytogeographically).

Centaureo julici-Laserpitietum sileris typicum

The nomenclatural type, *holotypus*, is relevé No. 13 in Table 1.

Centaureo julici-Laserpitietum sileris typicum var. *Brachypodium rupestre* var. prov.

Centaureo julici-Laserpitietum sileris asphodelosum albi subass. nov. hoc loco

The nomenclatural type, *holotypus*, is relevé No. 15 in Table 1 (Dakskobler et al. 2007: 172–178).

The differential species is *Asphodelus albus*.

Centaureo julici-Laserpitietum sileris var. geogr. *Pedicularis elongata*

Differential species of the geographical variant are *Pedicularis elongata*, *Knautia ressmannii* and *Euphorbia triflora* subsp. *kerneri*.

Mulgedio-Aconitea Hadač & Klika in Klika & Hadač 1944

Calamagrostietalia villosae Pawłowski in Pawłowski, Sokolowski et Wallisch 1928 (sin. *Adestyletalia alliariae* G. & J. Br.-Bl. 1931)

Calamagrostion arundinaceae Oberdorfer 1950

Laserpitio sileri-Grafietum golakae Poldini in Dakskobler & Poldini ass. nov. hoc loco.

The nomenclatural type, *holotypus*, is relevé No. 9 in Table 4.

Diagnostic species: *Grafia golaka*, *Laserpitium siler* (dominant species; the first with its southeastern-European montane distribution characterizes the association also phytogeographically), *Molopospermum peloponnesiacum* subsp. *bauhinii* and *Laserpitium peucedanoides* (geographical differential species).

4. CONCLUSIONS

The steep, sunny slopes of the southern and southwestern Julian Alps on the natural timberline are mainly dominated by beech. In the past, subalpine beech stands were often cleared for hay meadows. These have been abandoned for more than half a century and are gradually becoming overgrown with spruce, in places also with Austrian (black) pine, hazel and other deciduous trees. Abandoned hay meadows are dominated by tall herbs, especially *Laserpitium siler* and *L. latifolium*, in some localities in the Julian Prealps (the Stol ridge / Gran Monte, the Muzci ridge / Cime del Monte Musi) also by *Grafia golaka*. Considerable allelopathic potential has been determined for these species and this, in addition to other factors such as snowslides, slows down the succession process. Relatively long-term stages are physiognomically distinct; they can be clearly spatially delimited and should preferably be treated at the syntaxonomic level of association. We therefore described two new associations, *Centaureo julici-Laserpitietum sileris* (presented in more detail but without a valid description some years ago – Dakskobler 2003, Dakskobler et al. 2007) and *Laserpitio sileri-Grafietum golakae*. Despite some similarities they are two syndynamically different communities. In terms of succession, the first is becoming gradually overgrown by pioneer subalpine spruce stands (*Adenostylo glabrae-Piceetum* sensu Zupančič = *Homogyno sylvestris-Piceetum* sensu Exner – see Dakskobler 2003), while spontaneous afforestation in the second community proceeds through shrubs *Rubus idaeus*, *Salix appendiculata* and deciduous tree species (*Sorbus aria*, *S. aucuparia*, *Acer pseudoplatanus*, in places also *Ostrya carpinifolia*, *Amelanchier ovalis*), and only rarely through *Picea abies* or *Pinus nigra*. The newly described associations therefore belong to different classes, the first to the class of subalpine-alpine grasslands, and the second to the class of montane and subalpine tall herb communities. The stands of both, but especially those of the first association, *Centaureo julici-Laserpitietum sileris*, are characterised by a species-rich composition and a diverse mixture of diagnostic species of montane and subalpine grasslands, forest fringes and tall herbs. They are a site of some rare and protected plants, such as *Eryngium alpinum*, *Asphodelus albus* and *Iris sibirica* subsp. *erirrhiza*, an important habitat type for some birds, e.g. corncrake (*Crex crex*), and in some areas (e.g. on the slopes of the Stol ridge) also a habitat type of European conservation concern.

5. POVZETEK

Dve novi združbi visokih steblik z dominantnima vrstama *Laserpitium siler* in *Grafia golaka* v Jugovzhodnih Alpah (severovzhodna Italija, zahodna Slovenije)

Pred nekaj leti (Dakskobler 2003) smo preučevali razvoj gozda na nekdanjih senožetih v južnih Julijskih Alpah. Te senožeti so bile izkrčene v pasu subalpinskega bukovega gozda in smo jih kot razmeroma dolgotrajen sukcesijski stadij opisali kot provizorno novo asociacijo *Centaureo julici-Laserpitietum sileris* nom. prov. Kasnejše raziskave v različnih delih Julijskih Alp (zgornja Baška dolina, greben Breginjskega Stola, dolini Bale in Loške Koritnice) so pokazale, da je bila naša odločitev za samostojno asociacijo upravičena, saj ti sestoji oblikujejo fiziognomsko (po zunanjem videzu) in floristično jasno prepoznavno združbo, ki jo je moč dobro prostorsko omejiti in ki je zaradi počasnega zaraščanja razmeroma dolgotrajna. Novejše raziskave (prim. Kaligarič et al. 2011) kažejo na močan alelopatski potencial vrste *Laserpitium siler*, kar poleg drugih dejavnikov (snežni plazovi) zavira sukcesijski razvoj nazaj v gozd. Naredili smo precej dodatnih popisov in jim pridružili popise nekoliko podobnih sestojev v italijanskem delu Julijskih Alp in deloma tudi v Karnijskih Alpah. Primerjava zbranega popisnega gradiva je omogočila tipizacijo dveh novih asociacija, *Centaureo julici-Laserpitietum sileris* in *Laserpitio sileri-Grafietum golakae*.

Fitocenološke popise smo naredili po standarni srednjeevropski fitocenološki metodi (Braun-Blanquet 1964). Zbrane popise smo vnesli v bazo podatkov FloVegSi (Seliškar et al. 1993) in jih numerično obdelali s programskim paketom SYNTAX 2000 (Podani 2001). V prvem koraku smo med seboj primerjali 87 popisov sestojev z dominantnima vrstama *Laserpitium siler* in *Grafia golaka* v Julijskih Alpah, vključno s prigorjem (t. i. Julijiske Predalpe), in Karnijskih Alpah – slike 2 in 3. Sestoji z dominantno vrsto *Grafia golaka* iz Julijskih Predalp so se jasno razlikovali od sestojev z dominantno vrsto *Laserpitium siler* iz Julijskih in Karnijskih Alp. Na podlagi tega smo izdelali štiri analitske tabele (tabele 1, 2, 3, 4). V prvi so tipični sestoji asociacije *Centaureo julici-Laserpitietum sileris*, v tabeli 2 robni sestoji te asocicicije, ki kažejo na mogoče prehode k podobnim združbam visokih steblik in gorskih travnišč (začasno jih vrednotimo kot varianto *Centaureo julici-Laserpitietum sileris typicum* var. *Brachypodium rupestre*), v tretji

tabeli so sestoji z dominantno vrsto *Laserpitium siler* iz severovzhodne Italije (*Centaureo julici-Laserpitietum sileris* var. geogr. *Pedicularis elongata*) in v četrti tabeli sestoji z dominantno vrsto *Grafia golaka* (*Laserpitio sileri-Grafietum golakae*).

V drugem koraku smo izdelali sintezno tabelo (tabela 5), v katero smo poleg zgornjih štirih sintaksonov uvrstili še popise subasociacije *Centaureo julici-Laserpitietum sileris asphodelosum albi* nom. prov. (Dakskobler et al. 2007, tab. 1, popisi 8–33) in dve podobni robni združbi iz osrednje in jugovzhodne Slovenije: *Scabioso hladnikianaee-Grafietum golakae* Čarni 2007 iz Polhograjskega hribovja (Čarni 2007) in *Laserpitietum sileris* Springer 1987 var. geogr. *Dianthus croaticus* z Gorjancev (Čarni et al. 2005).

Primerjava sintaksonov iz sintezne tabele (tabela 5) jasno kažejo, da gre za različne združbe (slike 4 in 5). Sestoji asociacije *Centaureo julici-Laserpitietum sileris* se očitno razlikujejo od sestojev asociacije *Laserpitietum sileris* in sestoji asociacije *Laserpitio sileri-Grafietum golakae* od sestojev asociacije *Scabioso hladnikianaee-Grafietum golakae*. Razlike temeljijo na drugačnem višinskem pasu in drugačni potencialno naravni vegetaciji. Očitne razlike kaže tudi primerjava sestave po fitocenoloških skupinah (skupinah diagnostičnih vrst) – Tabela 6. V sestojih nove asociacije *Centaureo julici-Laserpitietum sileris* (nomenklaturni tip, holotypus, je fit. popis št. 13 v tabeli 1) je delež diagnostičnih vrst subalpinskih travnišč še tolikšen, da je smiselna uvrstitev te asociacije v zvezo *Caricion austroalpinae* in v razred *Elyno-Seslerietea*. Za uvrstitev nove asociacije *Laserpitio sileri-Grafietum golakae* (nomenklaturni tip, holotypus, je popis št. 9 v tabeli 4) v višje sintakonske enote je odločilna presoja, za katere združbe je značilna *Grafia golaka*. Uspeva tako v združbah visokih steblik iz razreda *Mulgedio-Aconitetea* kot v združbah gozdnih robovih iz razreda *Trifolio-Geranietea*. V našem primeru je *Laserpitio sileri-Grafietum golakae* montansko-subalpinska združba, zato je bolj ustrezna uvrstitev v razred *Mulgedio-Aconitetea* in v zvezo *Calamagrostion arundinaceae*.

Za sestoste obeh novo opisanih asociacij, še posebej prve, *Centaureo julici-Laserpitietum sileris*, je značilna bogata vrstna sestava in pisana zmes diagnostičnih vrst montanskih in subalpinskih travnišč ter gozdnih robov in visokih steblik. So življenjski prostor nekaterih redkih in zavarovanih rastlin, npr. alpske možine (*Eryngium alpinum*), zlatega korena *Asphodelus albus* in kojniške perunike (*Iris sibirica* subsp. *erirrhiza*), pomem-

ben habitatni tip za nekatere ptice, npr. za kosca (*Crex crex*) in na nekaterih območjih (npr. pobočja Stolovega grebena) tudi evropsko varstveno pomemben habitatni tip.

6. ACKNOWLEDGEMENTS

In our field work we were assisted by the late Prof. Dr. Tone Wraber, Mag. Boško Čušin and Dr. Jože Bavcon (relevés under Breginjski Stol), and Dr. Gino Gobbo (relevés under the Muzci ridge / Cime del Monte Musi). Associate professor Dr. Andraž Čarni helped with literature and his advice. Sincere thanks to two anonymous reviewers for their helpful remarks and improvements. Iztok Sajko made the synoptic picture of the study area and improved the Figure 2. English translation by Andreja Šalamon Verbič.
