

SYNTAXONOMIC AND NOMENCLATURAL NOTES ON THE SCREE VEGETATION OF CAUCASUS

Elena A. BELONOVSAYA¹,
Ladislav MUCINA^{2*} & Jean-Paul THEURILLAT³

Abstract

We present description of a new class for the high-altitude scree of the Caucasus (the *Lamio tomentosi-Chaerophylletea humilis*) and two alliances such as the *Scrophulario minimae-Sympyolomion graveolentis* (*Chaerophylletalia humilis*, *Lamio tomentosi-Chaerophylletea humilis*) and the *Scrophulario variegatae-Epilobion dodonaei* (*Epilobietalia fleischeri*, *Thlaspietea rotundifoliae*).

Key words: Georgia, alpine vegetation, Russian federation, riverine terraces, syntaxonomy.

Izvleček

V članku predstavljamo opis novega razreda na visoko ležečih meliščih na Kavkazu (*Lamio tomentosi-Lamietea tomentosi*) in dveh zvez – *Scrophulario minimae-Sympyolomion graveolentis* (*Chaerophylletalia humilis*, *Lamio tomentosi-Chaerophylletea humilis*) in *Scrophulario variegatae-Epilobion dodonaei* (*Epilobietalia fleischeri*, *Thlaspietea rotundifoliae*).

Ključne besede: Gruzija, alpinska vegetacija, Ruska federacija, rečne terase, sintaksonomija.

1. INTRODUCTION

The communities of the *Thlaspietea rotundifoliae* (Braun-Blanquet 1948, Zollitsch 1966, Englisch et al. 1993, Valachovič et al. 1997 etc.) are a common appearance in scree habitats of temperate, boreal and subarctic zones of Europe, where they could be found in all vegetation altitudinal belts, from the planare and colline belts as high as the alpine and subnival belts. In the mediterranean-climate regions of the Iberian Peninsula they are replaced by the *Phagnalo-Rumicetea indurati* (Rivas Goday et Esteve 1972) Rivas-Martínez, Izco et Costa 1973 (e.g. Ortiz & Puglar 2000, Rivas-Martínez et al. 2011) and in the (sub)mediterranean regions of the Central and Eastern Mediterranean, they

give way to the *Drypidetea spinosi* which, in our syntaxonomic concept, also includes the *Scrophulario-Helichrysetea italicici* S. Brullo et al. 1998 (Brullo et al. 1998) and the *Onosmo polyphyllae-Ptilostemonetea* Korzhenevsky 1990 (see Golub et al. 2011 for the latest syntaxonomic synthesis).

In Caucasus, Onipchenko (2002a: Table 3.1) described the *Chaerophylletalia humilis* and placed this order within the *Thlaspietea rotundifoliae*, although on page 18 he also noted that practically all diagnostic species of the class are missing in the Caucasian communities. Onipchenko (l.c.) also suggested that there were some diagnostic species of the European alliances and orders and therefore he decided to classify his new order (*Chaerophylletalia humilis*) within the *Thlaspietea*

rotundifolii. In fact only *Oxyria digyna*, *Cryptogramma crispa* and *Epilobium dodonaei* would qualify at the latter group. Interestingly, these species occur in the Caucasian scree communities at lower altitudes (perhaps (sub)montane to subalpine zone). The high altitudes (alpine to subnivale zones) of the Caucasus range are home to endemic-rich scree communities that appear to be floristically very different from the *Thlaspietea rotundifolii* of Europe (see also Nakhutsrishvili & Gagnidze 1999; Nakhutsrishvili 2003).

Belonovskaya (2012; based on earlier paper by Belonovskaya & Korotkov 2002) developed the Onipchenko's (2002) remark on the poor floristic relationship of the Caucasus scree communities and those of Europe further and introduced a new syntaxonomic concept – the *Veronica telephiifoliae-Lamietea tomentosi*, including one new order (*Veronica telephiifoliae-Lamietalia tomentosi*), with two new alliances (*Drabo scabrae-Eunomion rotundifoliae*, *Scrophulario minimae-Sympyolomion graveolentis*). Belonovskaya's (2012) paper however have not engaged fully with the syntaxonomy proposed by Onipchenko (2002) and all the suggested new syntaxonomic units (class, order and the alliances) are rendered either invalid according to the International Code Phytosociological Nomenclature; Weber et al. 2000) or (in one case) should be considered synonymous with an earlier syntaxonomic concept of Onipchenko (2002).

The prime aim of this paper is to validate the syntaxon names (or introduce a new one) and contribute to clarification of the syntaxonomic relationship of the Onipchenko's syntaxa and those suggested by Belonovskaya (l.c.) in the light of the new syntaxonomic-nomenclatural synthesis undertaken within so called 'EuroVeg-Checklist' (Mucina et al. in prep.).

2. NOMENCLATURE OF THE NAME '*VERONICO TELEPHIIFOLIAE-LAMIETEA TOMENTOSI*'

We agree that the endemic-rich, high-altitude scree communities of the Caucasus should be considered as a syntaxonomic concept different from the *Thlaspietea rotundifolii*. However, name '*Veronica telephiifoliae-Lamietea tomentosi*' (coined to accommodate these high-altitude Caucasian scree communities) has been invalidly (Art. 2b of the ICPN) published in Belonovskaya (2012:

967) because the name of the unique order – the '*Veronica telephiifoliae-Lamietalia tomentosi*' – include in the original diagnosis of the new class, was invalidly published at the time of the publication of the class name.

Indeed, the original diagnosis of the *Veronica telephiifoliae-Lamietalia tomentosi* contains two new alliances: the *Drabo scabrae-Eunomion rotundifoliae* and *Scrophulario minimae-Sympyolomion graveolentis*. There are four new associations in the original diagnosis of the *Drabo scabrae-Eunomion rotundifoliae* and three new associations in the *Scrophulario minimae-Sympyolomion graveolentis* (Belonovskaya 2012). All these seven associations are validly published because their original diagnosis contains only the type relevé (in Russian) presented in the Table 1 in Belonovskaya (2012) and each type relevé containing the name-giving taxa of respective association. On the other hand, both names of the new alliances are invalidly published because their type, indicated in the bottom of the Table 1 is given in Russian not matching the demand of the Art. 5 of the ICPN (Weber et al. 2000) that requires (*expressis verbis*) using the Latin terms *typus* or *holotypus*. Because of this technicality, the original diagnosis of the '*Veronica telephiifoliae-Lamietalia tomentosi*' containing no validly published alliances, the name remains invalidly published (Arts. 2b and 8 of the ICPN).

Besides, even if the new alliance *Drabo scabrae-Eunomion rotundifoliae* (Belonovskaya 2012) was validly published, the latter alliance name would have become automatically a superfluous name for the validly published *Chaerophyllum humilis* Onipchenko 2002 which was listed by Belonovskaya (2012) in the synonymy of the *Drabo scabrae-Eunomion rotundifoliae* on p. 968. Similarly, if the new order *Veronica telephiifoliae-Lamietalia tomentosi* were validly published, it would have been a homotypical synonym for the validly published *Chaerophylletalia humilis* Onipchenko 2002. It appears that syntaxonomically this order matches the Belonovskaya's '*Veronica telephiifoliae-Lamietalia tomentosi*'. Onipchenko (2002a: 168) listed both name-giving taxa (*Lamium tomentosum* and *Veronica telephiifolia*; syn. *V. minuta* C.A. Meyer; see Fig. 1) in the diagnosis of *Chaerophylletalia humilis*.

In order to avoid confusion in future, we introduce a new name for the invalid syntaxonomic concept of the '*Veronica telephiifoliae-Lamietea tomentosi*' and by recognising the role of *Chae-*

rophyllum humilis as one of the local dominating species, we coin the name and concept of the *Lamio tomentosi-Chaerophylletea humilis* (for the full protologue see below).

3. THE CASE OF MURBECKIELLION HUETII ONIPCHENKO 2002

The concept and name *Murbeckiellion huetii* was introduced for the first time by Onipchenko (2002a) who classified two associations within this alliance – the *Hyalopoo ponticae-Oxyrietum digynae* Onipchenko 2002 from siliceous, snow-rich alpine moraine habitats and the *Scrophulario variegatae-Epilobietum dodonaei* which was designated as the typus of the alliance. The latter association, however, was not validly described because the typus of the association has not been assigned. The designation of the typus of the *Scrophulario variegatae-Epilobietum dodonaei* was attempted by Onipchenko (2002b) who selected (relevé) '26/95, Table 3.3' in Onipchenko (2002a) as the typus. This attempt was, however, invalid since there are two relevés designated as 26/95: 0 26/95 and 1 26/95 in Table 3.3. Because the choice of the typus was not unequivocal, this validation cannot be recognised, hence both the *Scrophulario variegatae-Epilobietum dodonaei* and the *Murbeckiellion huetii* remain invalidly described.

The *Murbeckiellion huetii* is a syntaxonomically heterogeneous concept. The *Hyalopoo ponticae-Oxyrietum digynae* Onipchenko 2002 is floristically (and ecologically) closer to the *Hyalopoion ponticae* Rabotnova et Onipchenko in Onipchenko 2002 than any syntaxonomic unit of the *Lamio tomentosi-Chaerophylletea humilis*. The *Scrophulario variegatae-Epilobietum dodonaei*, on the other hand should be classified with the *Epilobietalia fleischeri*; it is characteristic of gravel alluvial banks of mountain streams and *Epilobium dodonei* plays a major role in these community (see Fig. 1A-E). It is therefore not our intention to validate the *Murbeckiellion huetii*, but rather coin a new name that would better represent the vegetation of gravel terraces of Caucasus – the *Murbeckiello huetii-Epilobion dodonaei* (for the protologue see below).

The low-altitude *Murbeckiello huetii-Epilobion dodonaei* is classified here into the *Epilobietalia fleischeri* Moor 1958 nom. cons. propos. (Raus et al. in prep.) of the *Thlaspietea rotundifolii*.

4. DESCRIPTION OF THE NEW SYNTAXA AND THE NEW SYNTAXONOMIC SCHEME FOR THE CAUCASIAN SCREE VEGETATION

Lamio tomentosi-Chaerophylletea humilis Belonovskaya, Mucina et Theurillat classis nova hoc loco
Holotypus: *Chaerophylletalia humilis* Onipchenko 2002 (Onipchenko 2002a: 18, 21)

Synonym: *Veronica telephiifoliae-Lamietea tomentosi* Belonovskaya 2012 (Arts. 2b & 8 of the ICPN)
Diagnostic taxa: *Cerastium multiflorum*, *Corydalis alpestris*, *Jacobaea erucifolia* subsp. *arenaria*, *Jurinea humilis*, *Lamium tomentosum*, *Veronica telephiifolia*

Chaerophylletalia humilis Onipchenko 2002

Synonym: *Veronica telephiifoliae-Lamietalia tomentosi* Belonovskaya 2012 (Arts. 2b & 8 of the ICPN)

***Chaerophylletalia humilis* Onipchenko 2002**
Synonym: *Drabo scabrae-Eunomion rotundifoliae* Belonovskaya 2012 (Arts. 5 & 8 of the ICPN)
Diagnostic taxa: *Cerastium alpinum*, *Chaerophyllum humile*, *Delphinium caucasicum*, *Draba scabra*, *Eunomia rotundifolia*, *Potentilla gelida*, *Saxifraga moschata*, *Tephrosieris integrifolia*, *Veronica minuta*

5. ACKNOWLEDGEMENTS

We thank Thomas Raus (Berlin, Germany) for checking the nomenclature and taxonomy of the diagnostic species mentioned in our paper. Marie Lochman (Perth, Australia) kindly scanned slides and Mikhail Dokukin (Nalchik, Russia) for the photos used in Figure 1. Zaza Kikvidze identified the locality in the Tergi River valley. LM thanks Gia Nakhutrishvili (Tbilisi, Georgia) and Georg Grabherr (Vienna, Austria) for making the visit to Caucasus in 1990 possible.
