

Hellenistic bell-shaped situlae with ivy leaves

Helenistične zvončaste situle z bršljanovimi listi

Martina BLEČIĆ KAVUR

Izvleček

Situlsa umetnost je kot specifična vizualna in pomenska sinteza v prazgodovinski in v zgodovinski železni dobi Evrope povezala številne kulturno različne družbe. Situle, ki so dale ime temu umetniškemu izrazu, niso bile le nosilke umetniške manifestacije in simbolne pripovedi. Odražale so spoznavno zrelost in sublimacijo družbe kot sprejeti emblem reprezentacije, statusa posamezne aristokracije. Območje severnega Jadrana se ponosno predstavlja s primeri iz starejšeželeznodobne situlske umetnosti in mlajšeželeznodobnimi, tako imenovanimi helenističnimi situlami. Izhodišče študije so ulomki helenističnih zvončastih situl z okrasom bršljanovega lista z Reke, ki so analizirani tako tipološko kot stilsko in ikonografsko v primerjavi z vsemi do sedaj poznanimi situlami tega tipa. V prispevku je posodobljen seznam zvončastih situl, predstavljeni so argumenti za njihovo natančnejšo kronološko pozicijo, za tipološko in tehnološko razdelitev v dve večji skupini z različicami ter s tem povezana različna torevtična središča njihove izdelave. Razprostranjenost helenističnih zvončastih situl z okrasom bršljanovega lista kaže, da sta bila vzhodna obala Jadrana in njeno zaledje prostor stika tako makedonskih kot tudi etruščanskih luksuznih torevtičnih izdelkov.

Abstract

Situla art, as a specific visual and semantic synthesis, connected numerous culturally different societies of the prehistoric and historic Iron Age of Europe. Situlae themselves, which gave the name to this art phenomenon, were not only carriers of artistic expression and symbolic narrative, but also reflected a cognitive maturity and sublimation of society as an accepted emblem of the way individual aristocracies represented their status. The area of the northern Adriatic boasts examples of the Early Iron Age situla art and the later, 'Hellenistic' situlae. The starting point of the present research are the fragments of Hellenistic bell-shaped situlae decorated with ivy leaves from Rijeka, which are analyzed typologically, as well as stylistically and iconographically in comparison with all the hitherto known situlae of this type. The article brings an updated list of bell-shaped situlae, presents arguments for their more precise chronological position, their typological and technological division into two major groups with variants and the related different toreutic centres of production. The distribution of Hellenistic bell-shaped situlae with ivy leaves shows that the eastern Adriatic coast and its hinterland were a place of contact between Macedonian and Etruscan luxury toreutic products.

Keywords: Northern Adriatic; Rijeka; Late Iron Age; Hellenism; bronze bell-shaped situlae; technology; typology; iconography

FRAGMENTS OF BELL-SHAPED SITULAE FROM RIJEKA

Rijeka, the northernmost point of the Kvarner Bay in the northern Adriatic, has yielded five fragments of bronze and one handle that have already been classified as the Hellenistic type of

bell-shaped situlae (*Fig. 1*). Unfortunately, their precise archaeological context is unknown. The Maritime and History Museum of the Croatian Littoral in Rijeka (*Pomorski i povjesni muzej Hrvatskog primorja, Rijeka*) keeps part of the archaeological finds under the inventory label of 'Old Fundus' without more explicit data on the

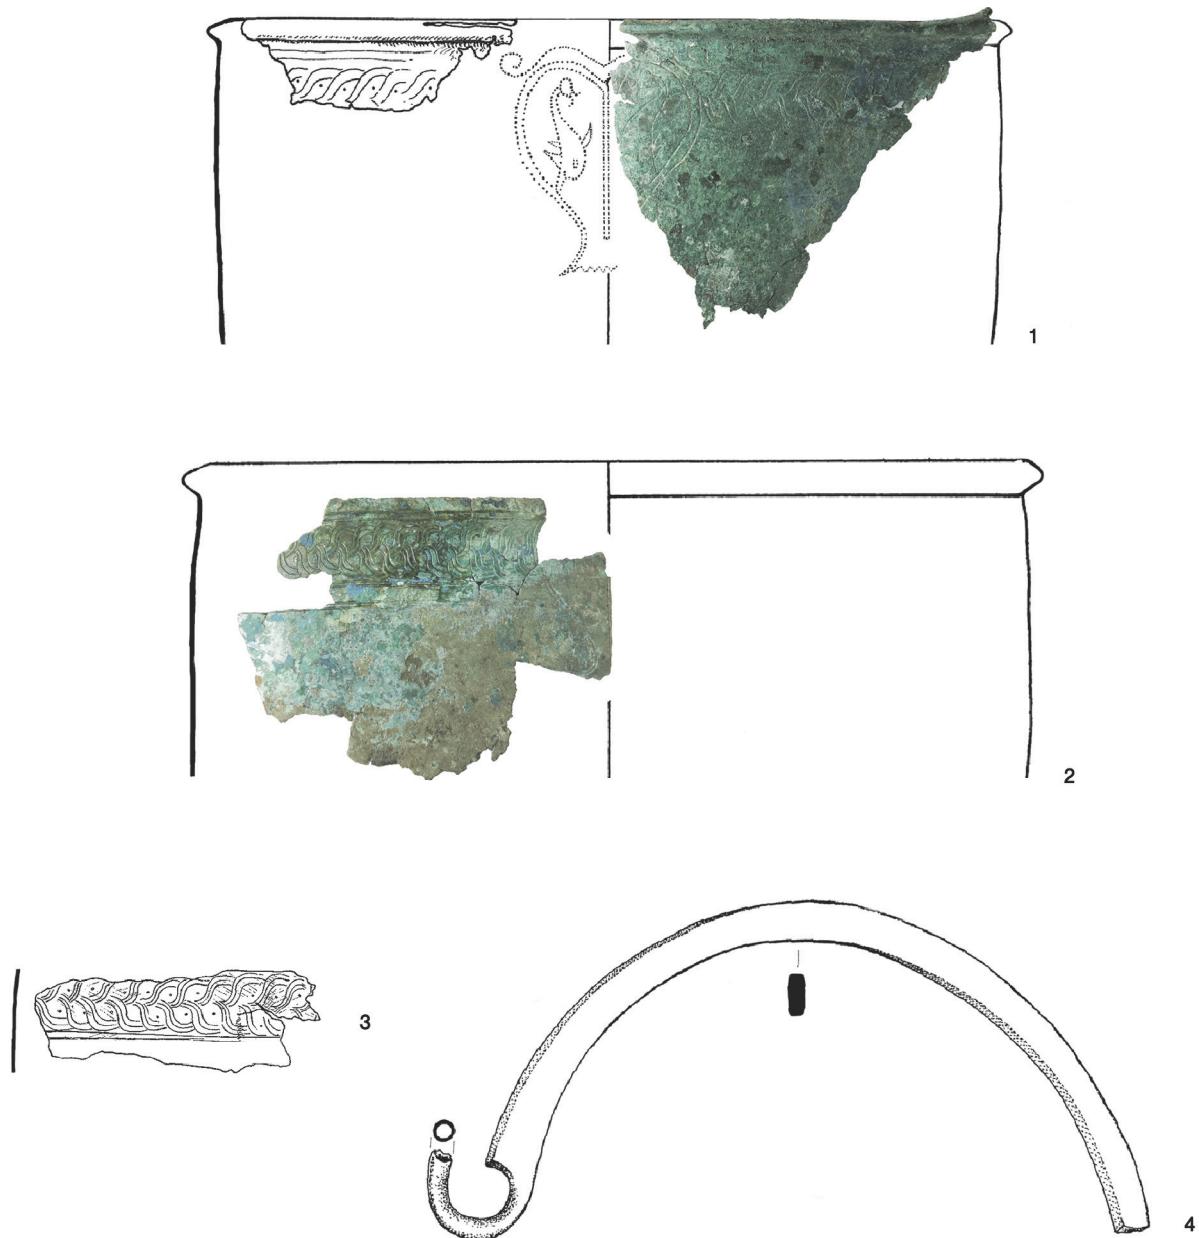

Fig. 1: Fragments of the bronze bell-shaped situlae and arc-shaped handle from Rijeka (No. 5). Scale = 1:2.

circumstances of discovery. According to the old inventory book, the fragments most likely came from the rescue investigations that took place at the end of the 19th and beginning of the 20th century in the area of the prehistoric, Roman and medieval necropolis between Andrješćica and Zagrad, i.e. between the former streets of *Via Vernada* and *Via Ciotta* in Rijeka.¹

¹ On the location of the ancient necropolis in Rijeka: Gigante 1944, 12; Matejčić 1985, 10. On the fragments of

All fragments are made of thin hammered bronze sheets and decorated with incising and punching. The detailed restoration and conservation of the fragments, completed in the laboratory of the Archaeological Museum in Zagreb (*Arheološki muzej u Zagrebu*),² showed that they can be divided

bell-shaped situlae from Rijeka: Blečić Kavur 2010, 285–307, 446–447, Fig. 4; Pl. 18: 299–300; ead. 2015, 179–185, Fig. 65.

² The restoration of the fragments was carried out by Ivan Gagro, the drawings and reconstructions were made by Miljenka Galić, for which I sincerely thank them.

into three groups according to the method and manner of decoration. This also made it possible to reconstruct two situlae with a high degree of certainty, while the reconstruction of one fragment must for now remain uncertain (*Fig. 1*).

The first group consists of two thin bronze fragments of a bell-shaped situla with the rim bent inwards. Below the rim runs an ornament of two strips of horizontal lines separated by a double cable pattern with punched dots in the interspaces. The largest fragment, 10.03 cm long and 8.32 cm wide, bears half of an ivy leaf capped by a tendril and holding a heraldic depiction of a dolphin facing down (*Fig. 1: 1*)³ (*Fig. 7; No. 5*).⁴

The second group consists of two bronze fragments of another bell-shaped situla. The preserved larger fragment, 9.89 cm long and 7.39 cm wide, bears three horizontal strips of two incised lines, the top two of which are separated by a triple cable pattern with ring-and-dots in the interspaces and half an ivy leaf. The ivy leaf holds two vertical parallel lines along the centre that divide it into two parts and a curved line or acanthus tip at the bottom end (*Fig. 1: 2*).⁵

The last fragment is also of a bronze sheet, 7.5 cm long and 2.6 cm wide, decorated with two incised horizontal lines separated by a triple cable pattern and punched dots in the interspaces. It was probably part of a situla or even a jug, goblet or cup (*Fig. 1: 3*).⁶

Only one arc-shaped handle, 19.16 cm long and 1.33 cm wide, has been preserved. It is rectangular in cross-section, with one end missing and the surviving hook hollow and round-sectioned. It was most likely the handle of one of the aforementioned situlae (*Fig. 1: 4*).⁷

Despite the not so fortunate circumstances of discovery and preservation, this study will, in an art-for-art-sake manner, focus on the artefacts themselves perceived as cultural capital and cultural expression.⁸ On the basis of a reliable identification

of the five fragments and a clear typological and technological classification of the bell-shaped situlae, it will present valuable information for their broader understanding in a comprehensive cultural and historical space. Evaluating the meaning of these luxurious metal vessels both individually and generally in the framework of cultural connections, their typological and stylistic differences will be shown to reflect not only their chronological positions, but also individual toreutic centres of the ancient Mediterranean. It is well known that bell-shaped situlae are spread from the central Mediterranean to the Black Sea and all to the distant parts of northern and western Europe (*Fig. 7*). The available evidence shows they came to light at only three sites on the eastern Adriatic shores, two of these in the northern Adriatic and linked to the Kvarner Bay (*Fig. 7; No. 5–6*). In addition, the article will continue the line of reflections focusing on the ‘symposium of diversity’ so characteristic of the heterogeneous and open modern society inhabiting these regions at the gloom of prehistory and the dawn of antiquity.

BELL-SHAPED SITULAE IN CONTEXT

For many years, bronze bell-shaped situlae were a popular topic in the archaeological discourse. Their role and beginning of production were sought in the Greek Classical period of the 5th century BC when small, χάδος vessels were used for carrying water, but also for mixing water with wine.⁹ Their production started slowly in the workshops of Athenian and Boeotian toreuts. The peak of production and use followed in the 4th and the early 3rd century BC, when they spread across the ‘Hellenistic world’, but also in Etruria and associated regions where they were referred to as *situlae*.¹⁰ These vessels were mostly linked to manifestations of symposia, banquets and festivities. But then again, their use was much broader and diverse, as confirmed in the production of innumerable pottery copies, especially in the framework of south Italian red-figure pottery

production centres.¹¹ Vital for their interpretation are the depictions of bell-shaped situlae from the end of the 5th and the 4th century BC in Greece (for example Boeotian) and *Magna Grecia* (e.g. Lucanian) or those of the Etruscan and Macedonian productions from the 4th and 3rd centuries BC. They occur in a multitude of depictions and iconographic compositions – from cosmetic and domestic scenes, presentations of warriors, rituals, festivities and numerous other activities. An important scene is that with Danae receiving the golden rain from Zeus on a Boeotian bell-krater dated to around 410 BC, where a bell-shaped situla with a ring-base is shown beside the head of Danae (Fig. 2).¹² There is also a majestic scene depicting a harvest festivity on a Lucanian volute krater of the *Karneia painter*, originating from Ceglie del Campo near Taranto (Fig. 3) and dated to the end of the 5th century BC.¹³ It shows a young Dionysus in the

¹¹ Zahlhaas 1971a, 71–73; Trendall 1989, 10, Fig. 2, Cat. 146, 228, 275–276.

¹³ Trendall 1989, 21–22, Fig. 23; De Julis 1996, 303, Fig. 275; cf. Denoyelle 2002; Durado 2005, Fig. 256; Museo archeologico nazionale di Taranto 8263 [<https://www.beazley.com/collections/louvre/ca925.html>] (28. 12. 2021).

centre of the composition, sitting on a stone and surrounded by a satyr, a maenad, a flute player and Artemis. In her left hand, Artemis carries a small, elegant bell-shaped situla on a moulded pedestal. The scene, and the vessel as a whole, is dedicated to dancing and amusement – to rites glorifying Dionysus. It is decorated with palmettes, Ionic *kymation* and tendrils of ivy. Numerous volute kraters of the same or similar production were found in the necropolis of Spina in Valle Trebbia, but none featured a bell-shaped situla.¹⁴ No such situlae came to light in the necropolis, contrary to stamnoid examples.¹⁵ Finally, it is worth recalling a scene on a bell-krater from Cumae, painted by the *CA painter* in the middle of the 4th century BC. On one side, it shows a woman in motion holding a bell-shaped situla in her right hand. The scene is even more impressive as she is offering the situla and a bowl (as gifts?) to a warrior (Fig. 4); it is possible that the scene depicts the rite of libation linked to the eschatological comprehension of the krater itself, of the depicted scene and the semantics of the funerary context.¹⁶

The majority of bell-shaped situlae were discovered in graves, some also in hoards and, of course, sanctuaries. In known contexts, these situlae were part of luxurious sets in representative, rich graves of individuals from the highest social and political structures in respective societies. Consequently, they were frequently interpreted as insignias, as precious diplomatic gifts, simply as *keimelia* or as ritual means of demonstrating the acknowledged and accepted eschatological practices and trends.¹⁷ Namely, kraters were no longer used in the funerary feasts and rituals of the 4th century BC – this is best demonstrated with the double sets from the Tomb of the Prince (III) in Vergina/Aigai¹⁸

¹⁵ The analysis of the resin and wine remains from the stamnoid situlae discovered in the rich male burial in Valle Trebbia 128 has again confirmed the Etruscan practise of mixing with resin for improving wines of lower quality (Hostetter, Beck, Stewart 1994, 211–225).

or Tombs Δ and Ζ from Derveni.¹⁹ They were replaced by bell-shaped situlae used for the same purpose – for ceremonial mixing of wine.²⁰ It is known from historical sources that Macedonians, as well as other peoples, whom the Greeks called ‘Barbarians’ in the northern Balkans, including Illyrians, drank pure, non-diluted wine, though they did ceremonially mix it with honey and spices, consequently making the sieve an important, and often discovered, part of the set (e.g. in Vergina/Aigai (Fig. 7; No. 48), Apollonia (No. 36), Vărbita (No. 106) or Montefortino (No. 8), especially in Graves 8, 23 and 35 with situlae).²¹

(© László Mátýus, Museum of Fine Arts, Budapest)

For the first time, the article presents a general, but still useful distribution map of bell-shaped situlae in the central Mediterranean, as well as the Balkan and Apennine Peninsulas that includes some finds from the coast of the Black Sea and its hinterland, as well as from the distant parts of Europe. Of the over 130 currently known examples (disregarding those from the art market), most attention has been paid to the situla from the wealthy Celtic grave from Waldalgesheim (No. 2), the situla from Montefortino, Grave 35 (No. 8),²² and similar known examples from the Eurasian continent (Fig. 7). Research mostly focused on the technologically and stylistically interesting, representative decoration in the form of palmettes below the attachment rings. Brian Shefton developed a

²² Brizio 1899, Pl. XI: 8; Frey 1996, Fig. 27:6. Unfortunately, the other two situlae from Graves 8 and 23 of the same necropolis are not as lavishly decorated and were therefore not so intensively discussed (Brizio 1899, Pl. IV: 13; V: 14; Dall'Osso 1915, 235). But the situla from Grave 23, beside the fact that it is decorated below the rim with an Ionic *kymation*, has the ends of the handle shaped in the form of duck's or swan's heads (Brizio 1899, Pl. V: 14).

complex interpretation regarding their decoration, their roles, implementation, differences and imitations in other materials.²³ Their list is constantly growing with ever new finds – for example from the Troad or Thrace (*Fig. 7*).²⁴ In recent years, there has been an extensive debate brought about by the discovery of an inscribed situla in a tumulus at Dardanos (No. 73) and studied by Beryl Barr-Sharrar. Developing the ideas of Shefton, she was able to define their production centres and stylistic features to demonstrate Athenian ancestors or originals.²⁵ Also important are the recent studies of Greek researchers such as Eleni Zimi, Annareta Touloumtzidou and especially Athanasios Sideris, who in numerous aspects advanced and widened our understanding of metal vessels and also of this type of situlae.²⁶

TECHNOLOGICAL AND TYPOLOGICAL ANALYSIS OF BELL-SHAPED SITULAE WITH IVY LEAVES

Four of the surviving fragments from Rijeka (*Fig. 1*) can be included into the group of *situla a campana tipo F* according to the general division that Maria-Vittoria Giuliani Pomes proposed in 1957.²⁷ Her typology was later further developed and supplemented; Gisela Zahlhaas identified these situlae as Type A1b.²⁸ Much more challenging is the identification of the fifth fragment, of which only a small part is preserved bearing a triple cable pattern below the rim (*Fig. 1: 3*) – such ornamentation also appears on jugs, goblets or cups. What certainly belonged to a situla is the rectangular-sectioned arc-shaped handle with one end missing (*Fig. 1: 4*). Its length allows us to identify it as an A type handle according to

²³ Shefton 1985; id. 1994; cf. Sideris 2021a.

²⁴ Treister 2002a, Fig. 4–5; Touratsoglou 2000, 65, Fig. 81; Sideris 2016; id. 2021a; id. 2021b.

²⁵ Athenian production of bell-shaped situlae has been inferred from the finds of numerous clay moulds and casts on the Athenian Agora (Barr-Sharrar 2000, 281–284, *Fig. 7*). One of the assumptions is that Athenian workshops produced exclusively for export north, to the Balkans, especially to Macedonia and Thrace. This interpretation was used to explain their lack in Attica (Barr-Sharrar 2000, 279, 283–284; ead. 2008, 6–8). For a similar interpretation also see Mikhail Treister (2001, 382).

²⁶ Zimi 2011; Touloumtzidou 2011; Sideris 2015; id. 2016; id. 2021a.

²⁸ Zahlhaas 1971a, 10–73, Pl. 1.

Wolfgang Schiering; these had ends in the form of a backward bent bud. Considering the dating of situlae with such handles, this example could be dated to the late 5th and the whole of the 4th century BC.²⁹

Giuliani Pomes, Poul Jørgen Riis and Zahlhaas adopted an analytical approach to the study of these vessels and thus created a foundation for their modern understanding.³⁰ They based their approaches on the typology and morphology of the vessels and handles, only considering their ornamentation at the end. In contrast, Schiering focused on the typology of the handles and formed individual groups with regards to the interpretation of their decoration.³¹ The manufacture or production centres of these situlae remains one of the most popular topics in the present discourse, with numerous hypotheses and opinions, both corresponding and contrary. Proposed, as logical candidates were workshops in Greek, Macedonian, south Italian, Etruscan or simply ‘Hellenistic’ centres. However, taking into consideration their discovery and appearance, it is likely that every major centre, especially a sanctuary, would have had a production or at least maintenance facility for these and other similar vessels, as Claude Rolley argued in his study involving the example from Delphi (*Fig. 5: 1*; No. 64).³²

The production and the associated technological characteristics enable us to divide the bell-shaped situlae into two groups.³³ The first group (or **Type I**) consists of cast examples finished with forging (*Fig. 5–6*). They had separately cast ring-bases. Their attachments were either cast together with the body of the situla or cast separately and soldered to the body while their decoration was finished subsequently. New research has shown that their production can no longer be connected to the ‘vast’ territory from the Black Sea to southern Italy, but rather more precisely located in northern Greek, Macedonian workshops (*Fig. 7*).³⁴ The second group (or **Type II**) includes situlae made of thin hammered bronze sheets with separately cast and

finished parts (attachments, decoration, handles and bases) (*Fig. 9*). This is characteristic of the Etruscan production that was based on earlier traditions.³⁵ These two groups show numerous variants regarding the production of decorative elements, which suggest other and different, apparently contemporary, ‘atelier signatures’.³⁶ These technological differences determined their morphology – the shape of the body and form of the rim. Bell-shaped situlae with ivy leaf- or heart-like ornament below the attachments were only considered superficially, though Zahlhaas already identified them as a group 50 years ago.³⁷ Interesting, although mostly ignored is the work of Rosa Proskynitopoulou, who increased the number of known examples, particularly those with ivy leaf ornament and attempted, with regards to their structure and the known tradition of ivy leaf ornamentation, to locate their production on the Peloponnese.³⁸ This was the consequence of a raised interest in this type of situlae and a greater number of known examples from the late 70s onwards. Today, their distribution is accepted as broad, though seemingly uneven (*Fig. 7*). Observing their distribution from a general technological perspective, differentiating between cast and forged situlae, we can clearly identify the more likely manufacture origin. In addition, a detailed examination of the ornament will demonstrate three different techniques to mark three variants, as follows:³⁹

Type I

The first group or Type I comprises situlae cast in a single piece with attachments and decoration below them representing Variant **Ia** (*Fig. 5: 1–8*). The ornament was executed with grooving, incising, inlaying or tinning, thus slightly raised and depicting floral motifs and tendrils in the upper part below the attachments. Characteristically, each leaf has a central rib dividing it into two equal parts. The leaves come in two variants: one with triangular or rounded terminals (*Fig. 5:*

³⁵ Giuliani Pomes 1957, 68; Zahlhaas 1971a, 8–9; Pförrer 1983, 241–242.

³⁶ Blečić Kavur, Kavur 2010, 59–61; Touloumtzidou 2011, 344–345.

³⁷ Zahlhaas 1971a, 16–17, 46–48.

³⁸ Proskynitopoulou 1979; cf. Touloumtzidou 2011, 343–346; Sideris 2016, 213–214.

³⁹ Cf. Sideris 2016, 213.

1–3) and the other with a denticulated terminal (*Fig. 5: 4–8*).⁴⁰ The ornament sometimes takes the shape of an ivy leaf, a popular motif in Greek art of the Late Classical and Hellenistic periods. This group includes the situlae from Tomb II in Altavilla Silentina (No. 26), Vergina/Aigai (No. 49) and Pistiana (No. 56), Delphi (No. 64), Budapest/Danube (No. 3), Caulonia/Kaminion (No. 30) in Calabria,⁴¹ Cernele (No. 109) in Romania, Koprinka/Seuthopolis (No. 88) in Thrace and Lenina (No. 114), the last one discovered beside the necropolis at Kuban (*Fig. 7*). Regarding the manufacture of this ivy leaf decoration, most similarities can be observed between the situlae from Delphi and the examples of Variant **Ia** from Caulonia/Kaminion, Budapest, Vergina/Aigai, Altavilla Silentina and Koprinka/Seuthopolis (*Fig. 5: 4–8*), as well as Pistiana. The closest parallels in the shape of the leaf terminal are the examples from Lenina and Cernele (*Fig. 5: 2–3*).

The second variant, i.e. **Ib** comprises situlae with attachments and ivy leaf ornaments cast separately and then soldered or otherwise fixed to the vessel (*Fig. 5: 9–16*).⁴² Such were the finds from Karaburma (No. 32),⁴³ Skillountia/Mazi (No. 72), Apollonia (No. 36), Värbitsa (No. 106), Gotse Delchev (No. 40), Chirinogi (No. 110),⁴⁴ Budva (No. 35), Bitola (No. 37) and Olympia (No. 71) on the Peloponnese, from Olynthos (No. 43), Artemision of Thasos (No. 42) and from Bolu–Göynük (No. 76), the last one with the ornament only identifiable of the contours under the rim (*Fig. 7*).⁴⁵ The manufacture of the leaf even suggests two subvariants. Similar examples are those from Karaburma, Skillountia/Mazi and Apollonia (*Fig. 5: 9–11*). The situlae from Gotse

⁴⁰ Blečić Kavur, Kavur 2010, 59–62, Fig. 3–4; cf. Touloumtzidou 2011, 344–345; Sideris 2016, 213–214, who defined this group as *Subtype b*.

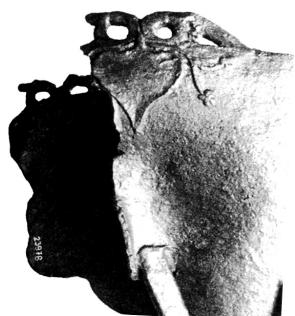

⁴¹ Rolley 2002a, Fig. 4–5. The situla also has the decoration in the form of tendrils and blossoms above the leaf – same as the situlae from Budapest and Lenina. Cf. Touloumtzidou 2011, Pl. 26β.

⁴² Blečić Kavur, Kavur 2010, 62–64, Fig. 3–4.

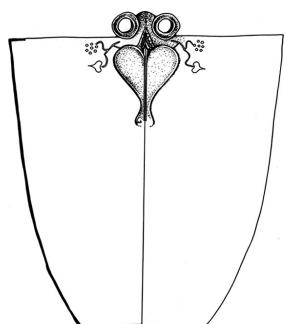

⁴³ Blečić Kavur, Kavur 2010, 59–66, Fig. 1: 9, 2. Rastko Vasić presented an overview of the Greek bronze vessels from the territory of former Yugoslavia, in which he did not discuss the Hellenistic finds separately (Vasić 1983, 190–191). But we have to point out that he clearly named Macedonian parallels, more exactly the workshops from Chalkidiki that were under strong influences from Attica.

⁴⁴ The situla is a rare example of gilded bronze. The author lists two similar situlae from Cernele and an unknown site in Transylvania (Şerbănescu 1999, 233–235, Fig. 3).

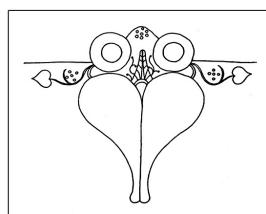

⁴⁵ Sideris 2016, 213, who defines this group as *Subtype a*.

Sl. 6: Zvončaste situle z vrezanim ornamentom bršljanovih listov, tip I, različica Ic – (za reference glej Seznam 1).
Ic: 1 Demir Kapija (No. 36); 2 Thrace (Trakija) (No. 120).*

Delchev and Värbitsa represent a regional version of the simplified decoration (*Fig. 5: 12–13*).⁴⁶ In contrast, the second subvariant consists of less elegant, coarser and simplified attachments as on the situlae from Chirnogi, Budva and Belgrade (*Fig. 5: 14–16*).⁴⁷ These also differ regarding the production manner of the body and base – they were cast separately and then riveted together (*Fig. 5: 15–16*). The different form, especially of the body and ring-base were undoubtedly the result of different toreutic workshops, as also suggested by the attachments. In this sense, the situla from Kozarevo (*Fig. 7; No. 87*) represents a special variant as it features the decoration of double leaves below the attachments.

Nevertheless, it is characteristic that these situlae, contrary to those with lavish palmette decoration,⁴⁸ completely lack decoration in the form of a ho-

⁴⁶ In a very similar way, an attachment in the form of an ivy leaf was also on a lamp with a tripod base from Derveni Tomb A (Themeles, Touratsoglou 1997, 37, A4, Fig. 5, 44). Regarding the production of the decoration, it seems that it presents a combination of leaf-like decoration of Variants I and II.

⁴⁷ Blečić Kavur, Kavur 2010, 59–62, Fig. 3–4. To this variant, we can also ascribe individual ivy leaf attachments with handles from Apollonia (Veseli 2012, 216, Pl. 3: 9).

⁴⁸ Cf. Sideris 2021a.

izontal band below the rim. However, there are exceptions (Variant Ic). One is a situla from Demir Kapija (No. 39) with a damaged body and missing base (*Fig. 6: 1*). It was cast in one piece and the ivy leaf-shaped decoration incised together with an Ionic *kymation* below the rim. The closest parallel comes from the not so distant Graešnica (No. 38), which was initially considered a Greek and later a south Italian product.⁴⁹ This kind of decoration was seen as an initially Attic characteristic of the 5th century BC, as demonstrated by the situla from Kalamaria (No. 45), further elaborated and used throughout the 4th century BC in the situlae from Macedonia and Thrace.⁵⁰ Despite certain specifics, the general characteristics of the situla from Demir Kapija show it can be included into Variant Ic. The closest parallels for the incised leaf decoration are on a situla from Skillountia/Mazi (No. 72) and a silver situla from Thrace (*Fig. 6: 2; No. 127*) (*Fig. 7*).⁵¹ This, however, only applies to the technique of production and ignores the motifs that display numerous differences. The example with the most complex motifs is that from Demir Kapija (No. 39),

Sl. 7: Razprostranjenost zvončastih situl (A). Izpostavljene so situle z okrasom iz bršljanovih listov pod atašami – tip I (B) in II (C) (dopolnjeno po Blečić Kavur 2015; za reference glej Seznam 1).

which was indubitably a product of Macedonian toreuts with a specific local characteristic used in the final elaboration. We can see its model in the situlae with palmettes of the Classical style, in which the decoration is positioned below the intact circumferential frieze as in the case of the already mentioned situla from Kalamaria (the Kalamaria Group according to Barr-Sharrar).⁵² Also ascribable to the Macedonian workshops is the situla from Graešnica (No. 38) with the closest parallel in the situla from Grave Δ in Derveni (No. 47) and a smaller example from Budva (No. 35) having the lavish palmettes with floral decoration located below the intact ornamental zone. Conventionally, it was considered a product of southern Italian workshops of the 3rd century BC.⁵³ From Budva comes another fragment of a

situla with palmettes included into a slightly later Waldalgesheim Group,⁵⁴ which is characterized by fused palmettes and attachments interlaced with S volutes or floral decoration constituting the ornamental zone.⁵⁵ Another fragment similar to the situlae with palmettes comes from Budva,⁵⁶ which remained unnoticed in foreign literature, but bears the characteristics of the Waldalgesheim Group, ascribed to the Macedonian production and dated to the 4th century BC. Besides Demir Kapija, other exceptions include the silver situlae without the horizontal decoration below the rim

⁵² Shefton 1994; Barr-Sharrar 2000, 285; Zimi 2011, 54.

from Vergina/Aigai attributed to the Vratsa Group.⁵⁷ Due to these imperfections, they are considered unfinished or regional products.⁵⁸

The described manner of manufacture and their decoration clearly indicates Greek and Macedonian workshops. Support for this claim comes from the studies of situlae with elaborate decoration in the form of palmettes. Casting in one piece (including palmettes and attachments) is not originally Macedonian, but became characteristic of this region and further north in Thrace later on.⁵⁹ It is actually the characteristic of Greek, especially Athenian craftsmen. Consequently, earlier situlae dated to the 5th century BC, such as the examples from Kalamaria, Aghios Athanasios⁶⁰ or the famous Peschanoe hoard in the region of Cherkasy on the Dnieper,⁶¹ should be considered as direct imports from Athens or at least from the workshops under a strong Athenian influence.⁶² This hypothesis is supported by the above-mentioned realistic depiction of a situla on the Boeotian bell-krater (*Fig. 2*) with the metaphor of Danae and Zeus dated to the end of the 5th century BC. Close, although often not formal, connections between Macedonia and Athens were reliably established in trade and generally in economic relations,⁶³ and were also reflected in the production of the workshops or ateliers at the Macedonian court. Obsessed by the style and sobriety of Athens, this production reached its peak in the period of Phillip II.⁶⁴ This is why numerous masters of different statuses migrated from Athens and different other cities to these Northern provinces. They adapted to local tastes and ideas, developing a new style visible on the

situlae from the end of 5th and beginning of the 4th century BC.⁶⁵

Applied, separately cast decoration certainly indicates Macedonian workshops. Confirmations for this claim can be found on the figural situlae made in the *repoussé* technique from Thrace⁶⁶ reaching their peak in the Derveni krater.⁶⁷ Ivan Venedikov adopted the same date for the situlae from Thrace – he set the examples with a ring-base to the 5th century BC, and the later examples with ivy leaf-shaped ornament and other situlae produced locally to the 4th century BC.⁶⁸ Is it possible to understand the technological and possibly chronological evolution of the bell-shaped situlae of Type I in the same way? Or, should we consider them slightly earlier and connected with the original Greek idea, as indicated by the situlae from Delphi or Skillountia/Mazi (*Fig. 5: 1,10*)? And should we consider the situlae of Variant Ib as a later variant perfected in Macedonian workshops, an assumption possibly supported by the situlae from Bitola and Karaburma or Skillountia/Mazi and Gotse Delchev, as Rolley already proposed?⁶⁹ In any case, the 4th century BC is the culmination of the Macedonian luxury metal production that developed with the growth and expansion of Macedonian power. Still, we should also assume the existence of other workshops either using models

⁵⁷ Andronicos 1999, Fig. 176–177; Zimi 2011, 196–197, Cat. 29–30; Sideris 2021a, 31.

⁵⁸ Barr-Sharrar 1982, 129; cf. Zimi 2011, 54.

⁵⁹ Pfrommer 1983, 250–263; Archibald 1998, 275–278; Sideris 2016, 198–214.

⁶⁰ Barr-Sharrar 2008, 6.

⁶¹ Rjabova 1991, 155–156, Cat. 103g; Parzinger 2007, 35, Fig. 5; Treister (1991, 75–76; id. 2008, 11–13, Fig. 8, 10–11) presented an overview of the research, discussions about their dating and manufacture centres, as well as chemical analyses with all the relevant earlier literature.

⁶² Barr-Sharrar 2000, 279–280, 285; ead. 2008, 14.

⁶³ It is well known and understandable that Macedonia supplied Athens with wood and pitch, materials urgently needed for the creation of a naval fleet (Barr-Sharrar 2000: 279; ead. 2008: 5–6).

⁶⁴ Barr-Sharrar 1982, 131; ead. 2000, 280–281; Pfrommer 1983, 236.

⁶⁵ Michael Pfrommer proved the indirectly observable influence of the Italic style of decoration on Macedonian toreutics, which further transmitted and intensively influenced the production centres in the northern Pontic area (Pfrommer 1982; id. 1983; Treister 2001, 157–158).

⁶⁶ Barr-Sharrar 1982, 127; Zahlhaas 1971a, 49–59; Venedikov 1977, 87–88; cf. Sideris 2016; id. 2021a; id. 2021b.

⁶⁷ Themeles, Touratsoglou 1997, 70–725, Fig. 13–17; Barr-Sharrar 2008, 30–46; cf. Treister 2001, 99–100, 109; with earlier literature on the Macedonian production and possible other, especially Italic influences.

⁶⁸ Venedikov 1977, 87–89; Pfrommer 1983, 252–254, 263; Barr-Sharrar 2000, 280. The situla from Värbica, completely forged, should be included into this late group (Venedikov 1977, 103, Cat. 33, Fig. 45; Barr-Sharrar 2000: 282, f.n. 33). It is damaged and corroded, missing the base, part of the body and the rim. But, relying on the documentation by B. Filow, G. Zahlhaas noted that one part still bore traces of soldering leaf-shaped attachments (Zahlhaas 1971a, 17, A20). The information is valuable as it suggests a local production which combined forging, well-established casting and applying leaf-shaped decoration. Consequently, it was included in Variant Ib. Despite differently executed decoration, the same could be true of Variant Ia, as concluded for the situla from Koprinka/Seuthopolis (No. 88) (*Fig. 5: 8*).

⁶⁹ Rolley 2002b, 57.

or working on demand to produce such vessels – especially on the Peloponnese and in Thrace, regions that yielded the greatest number of such situlae in aristocratic tombs.⁷⁰

It is well known that some situlae were used for a long time, even several generations. Besides ritual and simposiastic uses, as parts of ceremonial or funerary sets for feasting (Fig. 2–4), they were intensively used as utilitarian vessels. This is illustrated by the inscribed situla from Dardanos (No. 73) and the only remaining attachment from Vače (No. 4) (Fig. 7).⁷¹ The evidence that this kind of vessels were used even into the beginning of the 3rd century BC comes from a funerary stele from Demetrias in Thessaly,⁷² which is a Macedonian product made for Menelaus from Amphipolis.⁷³ The depicted situla is of distinctly elegant and harmonious proportions, resembling those from Bitola and Karaburma. The latter is characterized by the best execution in its group (Variant Ib) and the decoration of ivy leaves with a central rib continuing into a triangle mimicking a twig. As such, it is closely linked to the applied silver ivy leaves from the Derveni krater.⁷⁴ Although Rolley dated it to the 4th century BC, listing it among Macedonian products, most of the existing interpretations see it as an item looted during the famous Celtic invasion of Delphi in 279 BC?! However, the situla from Karaburma (No. 32) should be considered in the context of the situla from Bitola (No. 37) and all other bell-shaped situlae discovered in conti-

⁷⁰ Pfrommer 1983, 250–263; Archibald 1998, 275–277; Treister 2001, 381; Touloumtzidou 2011, 345–346; Zimi 2011, 54–55; Sideris 2016, 198–214; id. 2021a.

⁷¹ Guštin 1979, 87, Fig. 1, Pl. 3. The situla has two subsequently soldered attachments with a decoration of palmettes and S volutes, which passes over into discs for the double handles. The closest parallels for the attachments come from Olynthus (Shefton 1994, 590 B1, Fig. 1: 3), as Mitja Guštin already noted, considering them Mediterranean products reused on a bucket of a much later date and most probably of a north Italian provenance. Due to the S-shaped volutes and the complete palmettes-floral composition, which would ignore the circumferential frieze, the attachments could be included into the Waldalgesheim Group and precisely dated to the middle of the 4th century BC.

⁷² Painted marble. The situla is depicted in a dark brown colour suggesting shining polished bronze. The author used a real set in use at the time in Macedonia as model.

⁷³ Barr-Sharrar 1982, 124–125, Fig. 1; Blečić Kavur, Kavur 2010, 66, Fig. 6.

⁷⁴ Leaf-shaped ornaments with a central line were also visible on ceramic imitations from the Agora (Barr-Sharrar 2000, 283–284, Pl. 11–16; ead. 2008, 6).

ental Europe. It is less plausible that they were all bounty from Greece or elsewhere. What seems plausible is that the situla from Karaburma points to direct contacts of the Celts with the Macedonians, possibly as a diplomatic gift or *keimelia*. Or it could simply have come here as an item of trade travelling to a Celtic nobleman across the northern regions of Macedonia, as indicated by the presence of bell-shaped situlae (and other types of vessels) from Bitola.⁷⁵ According to new analyses of material culture, the grave with this situla from Karaburma is dated into the last quarter of the 4th and not the middle of the 3rd century BC, as previously generally accepted.⁷⁶

Type II

On the other side of the ‘world’, we can see that the situation was the same or at least similar in Etruria. There, mural paintings in the tombs of the elite serve as direct evidence of funerary feasts and banquets. In Tomba dell’Orco II in Tarquinia, for example, a *kylikeion* was painted flanked by Eros and Thanatos, the direct witnesses of all funerary feasts and rites (Fig. 8). According to Mario Torelli, this tomb dates to around 330 BC, but recent

⁷⁵ The second export line of Macedonian products must have followed the direction across Lake Ohrid to Apollonia on the coast and further to southern Italy – a direction of the future *Via Egnatia* running across northern Macedonia.

⁷⁶ Blečić Kavur, Kavur 2010.

dating pushes the whole complex of the family tomb to the early 3rd century BC.⁷⁷ Such dating follows the realistic representation of a luxurious set of metal vessels, especially bell-shaped situlae, which were, as already said, part of Etruscan creativity or art of manufacturers producing under Etruscan influence.

Characteristic of the second group or Type II of bell-shaped situlae (Fig. 9) was the producti-

on using thin bronze sheets fixed together with soldering, with a rim bent inward and separately cast base and attachments, which were later fixed to the body of the vessel (therefore these parts are mostly damaged and rarely preserved). The decoration on such situlae was completely different than on those of Type I. It comprised a broad band holding a double or triple cable pattern made with a combination of incising and punching. Such an ornament was very popular and widely used in Etruscan toreutics as it was easy to produce with cold incisions, but had a great decorative effect.

⁷⁷ Brendel 1995, 337–341; Torelli 1997, 237–243; Steingräber 2006, 206–210; Spivey 2006, 166–168.

Decorated in the same manner were the bronze jugs from the group of rich graves from Spina – in Valle Pega Grave 65A⁷⁸ and especially 136A that held bronze situlae adorned with the same interlacing and a silver fibula of the Certosa type.⁷⁹ The same decoration adorns the situlae from the rich tomb of Calini (Calisna) Sepus, Casone near Monteriggioni (No. 12), Norcia (No. 10) and Offida (No. 9) in Italy, Vizače/Nesactium (No. 6) and Rijeka (No. 5) on the northern Adriatic coast, and from Ošanići (No. 34) in the southern Adriatic hinterland (*Fig. 7; 9*).⁸⁰ All of them have an ivy leaf ornament incised below the attachments, much more elaborate and luxurious as the examples on the Type I situlae.⁸¹ It is made of two parallel lines that also run along the centre of the leaf, above the central part of the leaf is a diamond or triangle from which arise two spirally twisted lines on both sides, and the lower side ending in an undulating line or acanthus tip which is the characteristic of the situla from Ošanići (*Fig. 9: 2*) and the second situla from Rijeka (*Fig. 1: 2; 9: 3*). Produced in the same style is the ivy leaf ornament of the situla from Monteriggioni (*Fig. 9: 1*). They represent Variant IIa of bell-shaped situlae.

Occasionally and as specific narrative elements, ivy leaves held additional motifs, for example heraldic dolphins facing down, and identified in the Variant IIb bell-shaped situlae (*Fig. 9: 4–8*). Such an ornament is known on the situlae from Offida (*Fig. 6: 4–5*),⁸² Norcia (*Fig. 6: 6*), on the first example from Rijeka (*Fig. 1: 1; 9: 7*), and also, conceivably, from Vizače/Nesactium (*Fig. 9: 8*). For the moment, these are the only known examples, the value of which is diminished by the fact that

all of them lack a known archaeological context. Despite that, the situla from Offida was initially dated into the 5th century BC⁸³ and later to the Picenum VI phase that corresponds to the late 4th and early 3rd century BC, which is also the accepted dating for the situla from Norcia.⁸⁴ Dating to the same chronological frame of the 3rd century BC is the situla from Monteriggioni.⁸⁵

The fragment from Tomb II in Altavilla Silentina (No. 26) was broadly dated to the period of ‘Hellenism’, and noted by Zahlhaas as the closest parallel for the situla from Budapest. Aladar Radnóti dated the latter to the 3rd century and Zahlhaas re-dated them to the 2nd century BC.⁸⁶ Later, she determined all the situlae according to morphology and divided them according to decoration, ignoring the details of construction; situlae with different technological characteristics thus found themselves in the same group. Besides that, numerous approaches were put forward regarding the description, analysis, classification of these vessels and their cultural identification.⁸⁷ We should emphasise here that their dating, especially the ones with ivy leaf ornaments, is too low.

A situla that belongs to the discussed style is that from the Ošanići hoard (*Fig. 9: 2*). It was the subject of scientific discussions ever since Zdravko Marić published its analysis and dating.⁸⁸ Dragan Božić indirectly compared it with the finds from the Tomb of the Prince in Vergina/Aigai focusing on the larnax, dating it to the 4th and 3rd centuries BC and relating it to the south Italian workshops.⁸⁹ The larnax from Ošanići can certainly be correlated with that from Vergina/Aigai, and the Macedonian production as such.⁹⁰ However, the closest parallels are the examples made of bronze from Filimena in the Elis and Kurzhips kurgan on the Kuban. The luxurious silver larnakes from Vergina/Aigai and Aghios Athanasios are later.⁹¹ Following the assumption of Marić that the silver fibulae of the middle La Tène scheme were the latest element of the hoard, Rupert Gebhard used them to date

⁷⁸ Curti 1994, 297, Cat. 373.

⁷⁹ Curti 1994, 303, Cat. 472–475; 304; 483; Teržan 1976, Fig. 21: 2; cf. Mihovilić 2017, 263–264.

⁸⁰ Blečić Kavur 2015, 179–18, Fig. 64–65.

⁸¹ Kristina Mihovilić included the situla from Marzocca di Senigallia (Salvini 2003, 75, Fig. 4; cf. Mihovilić 2017, 263) in this group. Despite technological similarities and incised ornament below the rim, the situla from Marzocca lacks the ivy leaf-shaped ornament. The same goes for the situla from Montefortino – they cannot be included into the group of bell-shaped situlae with ivy leaf ornament.

⁸² The drawing of Vincenzo d' Ercole is not precise in comparison with the photograph although the situla was restored in 1987. At the same time, depictions of dolphins are a common element in Etruscan art of the Late Archaic period, that is the Third Style of mural painting, known from the Tomb of the Lionesses and the Tomb of Hunting and Fishing from Tarquinia, but also from vase painting, for example the Micali hydria (Brendel 1995, 185–191, 195–201, Fig. 120; 125; Spivey 2006, 114–118, Fig. 93–94).

⁹¹ Treister 2001, 280–281; Tsimbidiou-Avloniti 2004, 149–151.

his 5th horizon and proposed that the hoard from Ošanići be set to the middle or end of the 3rd century BC.⁹² Michael Pfrommer also focused on the situla and assumed that it should be a product of the 3rd century BC if not even earlier, considering it in relation to the larnax.⁹³ He dated the golden earrings of Hellenistic production in the hoard to the late 3rd and early 2nd century BC, comparing them with the finds from nearby Gorica and also Ohrid.⁹⁴ It was due to the presence of the Lesbian *kymation* on one of the matrices that he dated the hoard to the early 2nd century BC.⁹⁵ A much more analytical and detailed approach to the matrices was taken by Treister, who used extensive comparative material to identify a possible origin, function and dating for individual matrices.⁹⁶ By accentuating the chronological distance between individual matrices, he defined the difference between heirlooms, into which he included the situla and larnax, and utilitarian objects of a later date. As a compromise, he proposed a date towards the end of the 3rd and beginning of the 2nd century BC.⁹⁷

In any case, the situla is one of the earliest items in this hoard. Its main characteristics bring it close to the situlae from Monteriggioni and Rijeka (but also those from Vizače/Nesactium, Offida, Norcia and Marzocca) (Fig. 9) and it was certainly a product of the Etruscan cultural circle and/or from the wider Etruscan–Picenian cultural area from the end of the 4th and beginning of the 3rd century BC. The context, in which it was discovered could be, as Marić proposed, described as a hoard of a workshop specialised in different crafts and possibly organized as a family activity. When looking for the founder of this domestic enterprise, we have to agree with Treister⁹⁸ and his suggestion that this was a travelling artisan

⁹² Gebhard 1989, 123–124.

⁹³ Pfrommer 1990, 246, FK 86, f.n. 1971.

⁹⁴ It is interesting that the known examples of Hellenistic jewellery from the necropolis of Velje Ledine near Gostilj (Basler 1969, 8, Pl. 20: 98/7; 24: 122/12–13; 30: 3–4), Budva (Rendić–Miočević 1961; Popović 1994, 188–199; Krstić 2007, 174–175) or from Vis (Kirigin 1986, Cat. 293, 39; id. 1996, 165; Cambi 2002, 41, Fig. 40), which were already mapped by Petar Lisičar (1966, Fig 8), were not represented in the monumental catalogue of Pfrommer.

⁹⁵ Pfrommer 1990, 161, 246, 369, OR 206a.

⁹⁶ In several details of the matrix, Sineva Kukoč saw the possibility for the production of the coats of the Prozor type belt plates (Kukoč 1998, 21–22); Treister proposed the same for some of the relief matrices (Treister 2001, 290).

⁹⁷ Treister 2001, 281–293.

⁹⁸ Treister 2001, 296.

most probably originating from northern Greece, or actually Macedonia, and less probably from southern Italy. The situla might have been included in the property of the family as *keimelia* or in some other way.⁹⁹ The period of deposition and ‘family craft’ should be dated to the early 2nd century BC as proposed by Pfrommer and related to the tumults triggered by the repeated assaults by the Delmati who were constantly threatening the Daorsi in the 2nd century BC. The latter even had to pay *fóros* to them – an act which caused the Daorsi and Isseans to complain together to the Roman Senate. Their agony ended with the downfall of the Illyrian state in 167 BC and the status of Roman clients was granted to them.¹⁰⁰ This could be the date *post quem non* for the hoard from Ošanići. Finally, the same workshop could also be the origin of the figural attachments from the ‘tomb below’ Temple B in Vizače/Nesactium (No. 6),¹⁰¹ and of the only remaining attachment from Vrankamen (No. 33) (Fig. 7).¹⁰²

The enumerated parallels, as well as the technique of manufacture and decoration show that the bell-shaped situlae from Rijeka could be related to the spread of the Hellenistic style towards the end of the 4th and beginning of the 3rd century BC and attributed to the Etruscan workshops or those under the Etruscan influence. This is particularly relevant for the Picenian region, where such artistic syntheses occurred continuously, and Picenians themselves played a significant role as the mediators with the Adriatic coasts for numerous Etruscan goods. Moreover, material culture suggests that it is the area of the northern Adriatic that had a decisive position in spreading cultural contacts from the Italian Peninsula to the Carpathian Basin.¹⁰³ This is not new in the existing knowledge about the cultural connections of these regions, but only confirms the similarities in artistic aspirations and tastes, the possibilities and needs of societies inhabiting the shores of the northern Adriatic.

⁹⁹ Marić saw the worn-out appearance and the attachments detached from the body of the situla as an argument for its unconventional use (Marić 1979, 54).

¹⁰⁰ Zaninović 2003, 281, Šašel Kos 2005, 314.

¹⁰¹ Mihovilić 1996, 51, Pl. 10: 148, 150–155, 159; ead. 2001, 271, Fig. 4: 6–8; ead. 2017, 264–266, Pl. 2 (the base of the situla from Vizače/Nesactium suggests the same technique of production – a separately cast ring-base subsequently fixed to the body of the vessel).

ASPECTS OF ICONOGRAPHY

Iconographically, as well as semantically, the situlae with ivy leaf ornament below the attachments should be observed simply in connection with the ceremonies of symposiums and banquets where wine and herbs as aphrodisiacs acted as inevitable means of relaxation and elevation of spiritual energy leading to high spirits.¹⁰⁴ The presence of wine and ivy indicate the presence of Dionysus himself. The youngest god on Olympus was always linked to the mysteries of this world and the afterlife, to the enigma of birth, death, resurrection and incarnation causing his strongly-felt presence, also to funerary feasts glorifying the triumph over death. Therefore, Dionysus is one of the most common themes in Attic vase painting and was, in Archaic and Classical art, represented with clearly canonized attributes (kantharos and ivy, *thyrsos*, satyrs and maenads, snakes, donkey and panther/leopard).¹⁰⁵

Sl. 10: Bronasto zložljivo ogledalo z reliefnim ornamentom Satira (ali Pana), ki drži zvončasto situlo in vodi kozo k žrtveniku.

(© 2006 by Benaki Museum Athens)

In the 6th and 5th centuries BC, Dionysus was portrayed as an elderly bearded god in chiton and himation, as we can see on the kylix of Exekias from Vulci dated to around 530 BC.¹⁰⁶ After approximately 430 BC, he becomes a young beardless, half-naked effeminate god who will be interpreted as such throughout the 4th century BC. A young Dionysus with a young woman (Ariadne or Aphrodite) and their *gamos*, not *hieros gamos*, was a popular role model in south Italian vase painting of the 4th century BC,¹⁰⁷ and was as such present on all bell-shaped situlae with figural decoration, especially on those from Thrace.¹⁰⁸ Knowing the system of values and interactions, this is expected as Dionysus was directly linked to the Thracian territory where he spent part of his turbulent, difficult youth. The peak of this idealistic aspiration and luxurious program of visual expression was eternalized on the Derveni krater¹⁰⁹ and the already mentioned krater from Taranto (Fig. 3).¹¹⁰

In a reduced form, with Dionysus absent, there are the depictions with his companions and/or substitutes such as satyrs and maenads or heads of Silens, tendrils of ivy or vine.¹¹¹ An excellent example of this can be found on a bronze folding mirror with relief ornament representing a satyr (or Pan) holding a bell-shaped situla and leading a goat to the altar of sacrifice, dating to the late 4th or early 3rd century BC (Fig. 10).¹¹² As his iconographic and iconological model changes symbolically

¹⁰⁹ Buxton 2006, 66–67, 82–83; Barr-Sharrar 2008, 102–157.

¹¹⁰ From the 7th and especially in the 5th century BC, a large number of Greek and northern Greek masters are believed to have come to work to Italian centres (Trendall 1989, 17; Torelli 1997, 153–157; Spivey 2006, 58–59), though we should also consider possible direct imports from 5th century BC Greece and also from Macedonia. In either case, the miniature situlae from Locri Epizefiri (Orsi 1914, Fig. 34; 59; Meirano 2002, 204, Cat. 41.7) are considered not originally Italian. The same goes for the volute kraters from southern Italy (Barr-Sharrar 2008, 61–72).

¹¹¹ Osborne 1998, 149–151; Buxton 2006, 81–82; cf. Blečić Kavur 2012; ead. 2021.

and narratively, we are witnessing in some cases a complete rationalization of stylistically accepted models. Semantically, the presence of Dionysus will be completely anagrammed written down – it could even be simulated only with dolphins. Their connection with Dionysus is generally accepted and presented in the famous metamorphosis from Greek mythology – in the act of transforming pirates into dolphins¹¹³ as shown on the Etruscan finds of the kylix of Exekias and especially the Micali hydria. The latter is of special value as it is the earliest illustration of this story. Created by an Etruscan artist, the presence of Dionysus is only indicated with the tendrils of ivy.¹¹⁴ Of course, in this subject there are no coincidences – these are clearly presented beliefs. Dolphins were, as Dionysus himself, linked to transformation, rebirth, death and resurrection with a leading role as a *psychopompós*. In Etruria, they were, as we can see, present from the Archaic period onwards, even before the symbolic importing of Dionysus and his mysteries to Etruria.¹¹⁵ However, representations of people riding dolphins, bringing them into other worlds, will reach its peak in the Hellenistic art,¹¹⁶ in a period of the ‘best quality of bronze and silver vessels in the perspective of the elegance of their profiles and balanced proportions, of lovely

contours and discrete ornamentation’.¹¹⁷ Should we recognize the leaf-shaped or heart-shaped decoration below the attachments of the Type II situlae (Fig. 9) as ivy leaves that, together with the vessel full of the wine, conjure up Dionysus or at least evoke his spirit, a ritual and its mythic narrative complex, bound to the logic of the mystery? Dolphins, as a part of this decoration on the situlae from Norcia and Offida (Fig. 9: 4–6), as well as on the fragments from Rijeka and, most likely, Vizače/Nesactium (Fig. 1: 1; 9: 7–8), in an anagrammatic way relate the whole experience of the metamorphosis, i.e. of the new life. In fact, the *jump into the sea* or a liquid is an archetypal subject of mysteries – initiates experience death only to be reborn again. Leaping into the wine-coloured sea associated with the god initiates an escape from ‘bad destiny’ to reach salvation, and thus a good and blessed destiny.¹¹⁸ With a safe transition to the other world, it becomes in the same moment the act of heroization and incarnation of the deceased. Precisely in that context, the biographies of the situlae from Rijeka and Vizače/Nesactium undoubtedly represented the social status, the tradition of wine consumption, the eschatological thought and the ritual practices in funeral ceremonies and banquets of this area, which was synchronized with the universal essence of the vast Mediterranean Hellenism. After all, salvation and blessedness come out of the sea. So, *leaping into the deep, wine-coloured sea* and being reborn again.

Acknowledgements

I am deeply thankful to all who generously helped me in the long-term realization of this unusual study, first of all to Boris Kavur and Mitja Guštin (Univerza na Primorskem, Koper), then to Ranko Starac (Pomorski i povijesni muzej Hrvatskog primorja, Rijeka), Vera Krstić (Narodni muzej u Beogradu), Lucija Đurašković (Javna ustanova Muzeji i galerije Budve), Sabina Veseli (Instituti i Arkeologisë, Tiranë), Angeliki Kottaridi (Μουσείο Βασιλικών Τάφων των Αιγών, Vergina; Υπουργείο Πολιτισμού και Αθλητισμού, Athens), Athanasios Sideris (Thrace Foundation, Sofia; Masarykova univerzita, Brno) and to Jan Kysela (Univerzita Karlova, Praha).

¹¹³ Burkert 1990, 165–166; Buxton 2006, 82; cf. Csapo 2003, 82–83, Fig. 4.5–6; Bierl 2017, 248–249.

¹¹⁴ Camporeale 1992, 52–53, Cat. 77; Buxton 2006, 19; Spivey 2006, 114–115, 124–128, Fig. 93. A fragment of a black-figure amphora of unknown production with the depiction of four vertically placed dolphins comes from Adria (Vallicelli 2002, 192, Fig. 9).

¹¹⁵ Cristofani, Martinelli 1978, 131–133; Bottini 1991; Colonna 1991; Spivey 2006, 114–115; Kukoc 2009, 89–90.

¹¹⁶ An example is the monument of Lysicles in Athens dated to 336 BC. The upper frieze has a depiction of Dionysus and dolphins (Camp, Fischer 2002, 137). The latter were also often depicted on coins, for example on a stater from Taranto where it symbolizes the eponymous hero Taras (De Juliis 1996, 212, Fig. 202; Giove 2002, 276–277, Cat. 98; 100–101) or on coins from Syracuse or Naxos (Garraffo 2002, 161–165, 282–285, Cat. 114–121) – cities with strong mythological links to the god. Finally, the chthonic role of the dolphin in the iconography of the cultural groups from the Balkan Peninsula was especially prominent – on the already mentioned belt plates from Gostilj and Prozor, as well as on the matrices from Ošanići (Marić 1995, Fig. 17). At the same time, the dolphin is depicted on the emissions of coins of Jonius from Issa/Vis dated to the 4th century BC, as well as the coins of Labeati dated to the 3rd and 2nd centuries BC (Stipčević 1981, 68, f.n. 152).

Helenistične zvončaste situle z bršljanovimi listi

Povzetek

Dolga leta so bile bronaste zvončaste situle glavna tema podrobnih razprav v arheološkem znanstvenem diskurzu. Njihova vloga in začetek proizvodnje sta bila datirana v grško klasično obdobje v 5. st. pr. n. št., ko so bila majhna, tako imenovana vedra χάδος uporabljena za prenašanje in prinašanje vode, pa tudi za mešanje vode z vinom. Njihova izdelava se je začela v arhajskem obdobju, zlasti v delavnicih atenskih in beocijskih torevtov v 5. stoletju, vrhunc proizvodnje in uporabe pa je sledil v 4. in zgodnjem 3. st. pr. n. št. po vsem "helenističnem svetu", v Etruriji in sosednjih ozemljih (sl. 7). Večinoma so bile povezane z manifestacijami simpozijev, banketov in praznikov (sl. 2–4). Vendar pa je bila njihova uporaba mnogo širša in večpomenska, kar po-

trjuje tudi izdelava njihovih kopij iz keramike, predvsem v delavnicih z juga italskega polotoka.

Večina zvončastih situl je bila odkrita v grobovih, poznamo pa jih tudi iz zakladnih najdb in seveda iz svetišč. Skoraj vedno, razen v primerih, ko kontekst njihovega odkritja ni bil znan, so bile deli razkošnih servisov in reprezentativno bogatih grobov posameznikov iz najvišjih družbenih in političnih struktur tedanjih družb. Posledično so bile večkrat razlagane kot insignije, kot dragocena diplomatska darila, preprosto kot *keimelia* ali kot obredna sredstva za prikaz priznanih in sprejetih eshatoloških praks in trendov. V 4. st. pr. n. št. se v pogrebnih gostijah in obredih kraterji niso več uporabljali – nadomestili so jih z zvončastimi situlami, ki so jih uporabljali z istim namenom za

svečano mešanje vina. Iz zgodovinskih virov vemo, da so Makedonci in drugi, ki so jih Grki imenovali »barbari«, na ozemljih Balkana, vključno z Iliri, pili čisto, nerazredčeno vino. Toda vino je bilo ceremonialno pomešano z medom in začimbami, zaradi česar je tudi cedilo postal pomemben in pogosto odkrit del servisa (npr. v Vergini, Apolloniji, Vrbici ter v Montefortinu).

Pet odlomkov bronaste pločevine, okrašene s specifičnim okrasom, izvira z Reke (št. 5), najverjetnej z območja prazgodovinske nekropole na območju Andrejšćice in Zagrada, ter spada v vrsto helenističnih zvončastih ali ovoidnih situl (sl. 1). Vse so bile narejene iz tanke bronaste pločevine, dekorativni motivi v obliki večkratnega prepleta in delno ohranjenih bršljanovih listov ali ornamenta v obliki srca pa so bili narejeni z vrezovanjem in tolčenjem. Glede na obliko in način dekoracije sta bili s precejšnjo zanesljivostjo rekonstruirani dve posodi (sl. 1; 9). Na žalost kontekst njihovega odkritja ni znan – najverjetnejne izvirajo iz raziskav, ki so potekale v tem delu Reke konec 19. in v začetku 20. stoletja. Ohranjeni fragmenti (sl. 1: 1–2) se lahko vključijo v skupino t. i. situl *a campana* tipa F po tipologiji Marie-Vittorie Giuliani Pomes ali v tip A1b po Giseli Zahlhaas. Težje je določiti tipološko pripadnost tretjega odlomka posode, ohranjenega le z majhnim delom okrasa v obliki trojnega prepleta z vtolčenimi pikami na sredini (sl. 1: 3). Zagotovo pa lahko situli pripišemo polkrožni ročaj s pravokotnim prerezom (sl. 1: 4), ki je bil na koncu poškodovan. To so bili ročaji s konci v obliku nazaj upognjenega popka, pripisani vrstam A-ročajev po klasifikaciji Wolfganga Schieringa.

Glede na njihovo proizvodnjo in povezane tehnološke značilnosti lahko zvončaste situle z okrasom v obliki bršljanovega lista pod atašami razdelimo v dve skupini (sl. 5–6; 9). Prva skupina (ali tip I) vključuje primere, izdelane s tehniko vlivanja ter končno obdelane in oblikovane s kovanjem. Imele so ločeno vrita obročasta dna. Ataše so bile bodisi vrite skupaj s telesom situle bodisi vrite ločeno in prispaškane na telo, okras pa je bil izdelan naknadno (sl. 5–6). Zaradi novih spoznanj njihova proizvodnja ni več povezana z obsežnim ozemljem od Črnega morja do Velike Grčije, ampak je natančneje umeščena v severno-grške, pravzaprav makedonske delavnice. V drugo skupino (II) spadajo situle, izdelane iz tanke kovane bronaste pločevine z ločeno vlitimi in dodelanimi deli (ataše, okrasi, ročaji in dna). Ta produkcija je značilna za etruščanske delavnice, ki temeljijo na starejših železnodobnih tradicijah (sl. 9).

Tip I

Za prvo skupino ali tip I so bile značilne v enem kosu vrite situle. Primeri z vlitimi atašami in okrasi pod njimi predstavljajo varianto **Ia** (sl. 5: 1–8). Okrasi so bili zaključeni z dolbenjem, vrezovanjem in vstavljanjem. Posledično je bil okras rahlo dvignjen in plastičen, obogaten z dodanimi cvetnimi motivi in viticami v zgornjem delu. Značilno je, da je imel vsak list osrednje rebro, ki ga je delilo na dva enaka dela. Liste bi lahko nadalje razdelili na dve različici – prva se zaključuje s trikotnimi ali zaobljenimi listi (sl. 5: 2–3), druga pa z nazobčanim zaključkom lista (sl. 5: 4–8). Okras se včasih spremeni v bršljanov list, priljubljen motiv grške umetnosti pozne klasične in helenistične dobe. V to skupino spadajo situle iz Delfov (št. 64), Lenine (št. 114) in iz Cernele (št. 109), potem iz Caulonie/Kaminijona v Kalabriji (št. 30), Donave pri Budimpešti (št. 3), iz Vergine/Aigaia (št. 48), iz grobnice II v Altavilli Silentini (št. 26), iz Koprinke/Seuthopolisa (št. 88) ter iz Pistiane (št. 56).

V drugo varianto **Ib** je treba vključiti situle z atašami in okrasi v obliki bršljanovega lista, ki so bili posebej vlieti ter naknadno pritrjeni oziroma prilotani na posodo. Takšne so bile najdbe situl iz Karaburme (št. 32), Skillountie/Mazi (št. 72), Apollonije (št. 36), Vrbice (št. 106), Goce Delčeva (št. 40), Chirnogija (št. 110), Budve (št. 35), iz Bitole (št. 37), Olimpije (št. 71), Artemiziona na Tasosu (št. 42) ter najverjetnejne iz Bolu-Göynüka (št. 76) (sl. 7). Tudi tu lahko ločimo dve varianti izdelave lista – podobni so primeri iz Karaburme, Skillountie/Mazi, Goce Delčeva, Vrbice, Koprinke/Seuthopolisa in Apollonije. Medtem ko druga varianta vključuje precej robustne ter poenostavljene ataše na situlah iz Chirnogija, Budve in Beograda (št. 125) (sl. 7).

Posebnost je situla iz Demir Kapije (št. 39) s poškodovanim trupom in manjkajočim dnem. Izdelana je bila v enem kosu, medtem ko je bil okras v obliki bršljanovega lista vrezan (sl. 6: 1), pod obodom pa je imela vodoravni friz z okrasom jonske kime. Najboljša primerjava zanje prihaja iz ne tako oddaljene Graešnice (št. 38). Ker ob razpravi o katerikoli situli ne moremo spregledati njene edinstvene proizvodnje, bi morali situlo iz Demir Kapije na podlagi njenih splošnih značilnosti vključiti v varianto **Ic**. Najboljše primerjave za vrezani listni okras lahko opazimo na situli iz Mazija (št. 72) in srebrni situli iz Trakije (št. 126) (sl. 6: 2). Situla iz Demir Kapije ima naj-

kompleksnejši okras in je bila nedvomno izdelek makedonskih torevtov, ki so na koncu okrasitve dodali specifične lokalne značilnosti. Makedonskim delavnicam bi morali pripisati še situlo iz Graešnice, situle iz groba Δ v Derveniju (št. 47) in manjšo situlo iz Budve, ki ima razkošne palmete s cvetličnim okrasom pod nedotaknjenim frizom.

Tip II

Na drugi strani "sveta" pa lahko vidimo, da je bila situacija enaka ali vsaj podobna v italski Etruriji. Tam so bili na stenskih poslikavah v grobnicah družbenih elit upodobljeni pogrebne svečanosti in banketi. V Tomba dell'Orco II v Tarkviniji je bil upodobljen *kylikeion*, ob katerem sta stala Eros in Tanatos, neposredni priči vseh pogrebnih gostij in obredov (sl. 8). Njegova datacija je v skladu z realističnim prikazom razkošnega nabora kovinskih posod, še posebej zvončastih situl, ki so bile, kot že rečeno, del etruščanske ustvarjalnosti ali proizvajalcev, ki so izdelovali pod etruščanskim nadzorom.

Zanje je bila značilna izdelava iz tanke bronske pločevine, spojene s spajkanjem, z izvihanim ustjem, ločenim vlitim dnom ter atašami, naknadno združenimi s telesom posode. Dekoracije so bile povsem drugačne od tistih v skupini I. Šlo je za širok pas, zapolnjen z dvojnim ali trojnim prepletom, ki je bil narejen s kombinacijo vrezov in točk. Tak ornament je bil zelo priljubljen v etruščanski torevtiki, saj ga je bilo enostavno izdelati s hladnim vrezovanjem ter je imel velik dekorativni učinek. Enako so bili okrašeni bronasti vrči iz skupine bogatih grobov iz Spine, Valle Pega 65A in 136A, kjer so bile odkrite tudi bronaste situle, okrašene z istim prepletom, in srebrna fibula tipa Certosa. Tovrsten okras krasiti situle iz bogate grobnice Celenii Sepus blizu Monteriggioni (št. 12), Norcie (št. 10) in Offide (št. 9) v Italiji, Vizač/Nezakcija (št. 6) in z Reke (št. 5) na severni jadranski obali ter Ošanićev (št. 34) v hercegovskem jadranskem zaledju (sl. 9). Vsi imajo pod atašami vrezan okras bršljanovega lista, veliko bolj razvit in razkošen kot pri situlah I. tipa. Izdelan je iz dveh vzporednih črt z osrednjim ločnico, z rombom ali trikotnikom in spiralnimi viticami nad listom, oz. s spodnjo stranjo, ki se konča v obliki valovite črte ali akantovega vršička, kar je značilnost situl iz Ošanića, prve situle z Reke in situle iz Monterrigionija (sl. 9: 1–3), ki so uvrščene v ločeno varianto IIa. V drugo, varianto IIb prištevamo situle, kateri listasti

okras je dodatno izpolnjen z nasprotno in navzdol vrezanimi delfini; iz Offide, Norcie, z Reke in verjetno iz Vizač/Nezakcija (sl. 9: 4–8).

Ikonografsko, pa tudi semantično, bi bilo treba situle z okrasom v obliki bršljanovega lista pod atašami opazovati z vidika povezav s ceremonijami simpozijev in banketov, kjer so vino, različni alkoholni eliksirji in zelišča kot afrodiziaki delovali v vlogi neizogibnega sredstva za sprostitev in dvig duhovne energije. Prav upodobitev trte in bršljana kaže na prisotnost Dioniza. Najmlajši bog na Olimpu je bil vedno povezan s skrivenostmi tega in posmrtnega življenja, z enigmo rojstva, smrti, vstajenja in utelešenja. Njegovo navzočnost je bilo čutiti prav pri pogrebnih slavjih, kjer se je slavilo zmagoščevje nad smrtno. Zato je Dioniz ena najpogostejših tem na atiškem vaznem slikarstvu in je bil v obdobju arhaične in klasične umetnosti prikazan z jasno kanoniziranimi atributi (kantaros in bršljan, *tyrsos*, satiri in menade, kače, osel in panter/leopard). Od 6. in 5. stoletja je bil prikazovan kot starejši bradati bog v kytonu in himtionu, kot lahko vidimo na kiliksu Eksekijasa iz Vulcija, datiranem okoli leta 530 pr. n. št. Toda približno po letu 430 pr. n. št. je postal na upodobitvah mladi brezbradi, napol goli efemizirani bog, ki ga bodo kot takega razlagali v celotnem 4. st. pr. n. št. Mladi Dioniz z mlado žensko (Ariadno ali Afrodito) in njihov *gamos* je bil priljubljen motiv v južnoitalskem vaznem slikarstvu 4. stoletja in prisoten na vseh zvončastih situlah s figuralnim okrasom, zlasti na tistih z ozemlja Trakije. Če poznamo sistem vrednot in interakcij, bi bilo to mogoče pričakovati, saj je bil Dioniz neposredno povezan s tračanskim ozemljem, kjer je preživel del svoje burne, nikakor enostavne mladosti. Vrhunec tega idealističnega hrepenenja in razkošnega programa vizualnega izražanja je bil okras na kraterju iz Dervenija in na kraterju iz Taranta (sl. 3).

V reducirani obliki, v Dionizovi odsotnosti, so bili upodobljeni njegovi nadomestki, kot so satiri in menade ali glave Silenov, vitice bršljana ali trte. Odličen primer tega lahko opazujemo na bronastem zložljivem ogledalu z reliefnim ornamentom upodobljenega satira, ki drži zvončasto situlo in vodi kozo k žrtvenemu oltarju, datiranem v pozno 4. in zgodnje 3. st. pr. n. št. (sl. 10). Ker se je njegov ikonografski in ikonološki model na simbolni in narativni način spremenjal, smo v nekaterih primerih bili priča popolni racionalizaciji stilistično spretjetih modelov. Semantično je bila prisotnost Dioniza povsem anagramno zapisana – simulirana celo samo z delfini. Njihova povezava

z Dionizom je splošno sprejeta in predstavljena v znameniti metamorfozi iz grške mitologije – v dejanju preobrazbe piratov v delfine, kot kažejo etruščanske najdbe Eksekijasovega kiliksa in še posebej Mikalijeve hidrije. Slednja ima poseben pomen, saj je najstarejša ponazoritev te zgodbe. Ustvaril jo je etruščanski umetnik, navzočnost Dioniza pa je nakazana samo z viticami bršljana. Delfini so bili z vlogo psihopompa, kot Dioniz sam, povezani s preobrazbo, ponovnim rojstvom, smrtno in vstajenjem. V Etruriji so bili, kot lahko vidimo, prisotni od arhajskega obdobja, kar je bilo še pred simboličnim uvozom Dioniza in njegovih misterijev v Etrurijo. Toda upodobitve ljudi, jahajočih delfine, ki jih prinašajo v druge svetove, bodo dosegle svoj vrhunc v helenistični umetnosti. Ali bi morali v listasti obliki oziroma v tako imenovanem srčastem okrasu pod atašami situl II. tipa (*sl. 9*) dejansko prepoznati bršljanove liste, ki bodo skupaj s posodo, polno vina, če ne že pričarali Dioniza, vsaj vzbudili njegov duh, obred in njegov mitološki pripovedni kompleks.

Delfini kot del te dekoracije na situlah z Reke, iz Norcie, Offide in verjetno Vizač/Nezakcija na znakovni način pripovedujejo o celotni izkušnji

metamorfoze. *Skok v morje* ali v tekočino je tipičen motiv misterijev – inicirani doživljajo smrt samo zato, da se ponovno rodijo. S skokom v vinsko obarvano morje, povezano z bogom, inicirani pobegnejo pred “slabo usodo”, da bi dosegli zvečičanje in s tem blagoslovjeno usodo. In situle z Reke in iz Nezakcija, kot kulturni kapital in umetniške ekspresije, jasno prikazujejo družbeni status, tradicijo uživanja vina, eshatološko misel in obredne prakse pri pogrebnih slovesnostih na tem ozemlju, ki so bili sinhronizirani z univerzalnim bistvom helenizma. Navsezadnje iz morja prihajata odrešitev in blagoslov.
