Abstract - A short-term faunistic survey of Lepidoptera of the Mavrovo National Park (Republic of Macedonia) resulted in records of 401 species of Lepidoptera, almost twice as much as hitherto known from this area. Of particular interest are 48 species which, according to Fauna Europaea, are new country records. Furthermore, 4 species are probably new to science.

KEY WORDS: faunistics, new records, Lepidoptera, Mavrovo National Park, Republic of Macedonia

Izvleček - PRISPEVEK K FAVNI METULJEV MAVROVSKEGA NARODNEGA PARKA (REPUBLIKA MAKEDONIJA)

Kratkotrajna favnistična raziskava metuljev (Lepidoptera) Mavrovskega narodnega parka v Republiki Makedoniji je dala podatke o 401 vrsti metuljev, skoraj dvakrat toliko, kot jih je bilo s tega območja znanih poprej. Posebno zanimivih je 48 vrst, ki po bazi podatkov Fauna Europaea za državo se niso bile znane. Štiri vrste pa so verjetno nove za znanost.

KLJUČNE BESEDE: favnistika, nove najdbe, Lepidoptera, Mavrovski narodni park, Republika Makedonija

Introduction

The lepidopterological exploration of Macedonia has a long tradition, reflected by 4 volumes dealing with the fauna of this country (Thurner 1964, Daniel 1964, Pinker 1968, Klimesch 1968). Though partially out of date, these outstanding reviews are together with other historical and recently published sources (e.g. Michieli 1963, Rebel & Zerny 1931, Schaider & Jaksic 1989, Verovnik et al. 2010) still of major importance when dealing with the faunistics of this country. However, the level of exploration varies much within Macedonia as most of the Lepidopterologists devoted their time to the southern, central and eastern part of the country, whereas the north-western part was largely neglected, probably because of difficulties in accession. As a consequence the largest National Park of the country, Mavrovo, which covers 73,088 ha and includes the highest peak of Macedonia, Korab (2764 m a.s.l.), is insufficiently explored. Only 201 species of Lepidoptera have been recorded from this area so far, the majority belonging to butterflies s.l. with 123 taxa (Krpac & Lazarevska 2008, Krpac 2010, Leone & Puccioni 2009).

These shortcomings combined with a general interest in the alpine element of the Macedonian fauna ended up in the organization of a week-long trip to Mavrovo National Park lasting from 28th of July to 3rd of August 2011.

Methods and material

Our field research lasted from 28th of July 2011 (evening) to 3rd of August (morning). The weather conditions were quite unfavourable with regular thunderstorms in the late afternoon (or at other times of the day), cloudless sky in the night and thus wet vegetation and chilly temperatures as low as 4° C. Furthermore, the field research was with few exceptions hindered by strong wind in the night.

To ensure a maximum of species records we relied on a variety of different methods. As we expected the majority of species to be nocturnal, several different types of light traps were used more or less simultaneously for our field work: 2 light towers (15 W UV), 1-2 illuminated white sheets (125 W UV), 2-3 automatic light traps (15 W black light). Due to bad weather conditions light trapping usually only lasted until about midnight with the exception of the automatic traps which ran all the night. Diurnal species were collected with a butterfly net during sunshine and by sweeping vegetation at dusk. Finally leaf-miners were collected during the day.

Voucher specimens of most species were collected, pinned and spread in the field and it is planned that Barcodes will be sequenced at a later stage. Identification of species is usually based on phenotypical appearance. However, of several critical taxa we made genitalia slides to assure identification. The major part of the material is stored in the Natural History Collections of the Tiroler Landesmuseum Ferdinandeum, Innsbruck, Austria.

Site descriptions

28.7.2011-1.8.2011

1. Korab, Korabska jezero, Kobilino pole, 2080-2180 m (camp and main collecting area at 2100 m, N $41^{\circ}46'42''$ / E $20^{\circ}34'55''$) (Fig. 1). Alpine grassland on crystalline schist that is frequently mixed with limestone.

2. Korab, eastern ridge, ca. 2325-2400 m (about 200 m around crest on marked track, N $41^{\circ}47'08''$ / E $20^{\circ}34'46''$) (Fig. 2). Rocks with Alpine-cushion vegetation mixed with Alpine grassland, partly on crystalline schist and on limestone.

3. Korab, summit ridge, ca. 2700-2750 m (N $41^{\circ}47'20''$ / E $20^{\circ}32'48''$) (Fig. 3). Rocks with alpine-cushion vegetation mixed with Alpine grassland, mainly limestone (summit area) but also spots with crystalline schist at southern part of the ridge.

1.8.2011-3.8.2011

4. Radika valley, around bridge 10 km NNW Sveta Voda, 1290-1340 m (N $41^{\circ}47'51''$ / E $20^{\circ}37'53''$) (Fig. 4). Schistaceous crystalline rocks and rocky scree mixed with breccie, strongly covered with lichens, bushy *Fagus-Ostrya*-forest with some *Pinus* and *Abies* on the slopes, *Salix* near the river; on the steep schistaceous rocks *Juniperus sabina*, dry open slopes with very rich mixed flowery vegetation.

Fig. 1. Korab, ca. 2100 m, camp and main collecting area.

Fig. 2. Korab, eastern ridge, ca. 2400 m.

Fig. 3. Korab, summit ridge, ca. 2700-2750 m.

Fig. 4. Radika valley, ca. 1300 m.

Fig. 5. *Autographa aemula*, new record for the Balkan Peninsula.

Results

Altogether 401 species of Lepidoptera from 37 families were recorded including 48 new records for the Republic of Macedonia (according to Fauna Europaea), and furthermore 4 species probably new to science. The vast majority of species belong to nocturnal families and only 52 taxa are butterflies s.l. (Papilioidea and Hesperioidea). The species are listed in Table 1 together with localities.

The taxonomy of the checklist with few exceptions follows the new version of Fauna Europaea (<http://faunaeur.org>) published in 2010. The systematic arrangement mainly follows ID numbers supplied by the management of Fauna Europaea.

Table 1. Records of Lepidoptera from the Mavrovo National Park, 28.7.2011-3.8.2011.

Abbreviations: * = new country record; ! = (probably) new species to science; 1 = Korab, 2080-2180 m; 2 = Korab, 2325-2400 m; 3 = Korab, 2700-2750 m; 4 = Radika valley NNW Sveta Voda, 1290-1340 m.

Discussion

About 400 species of Lepidoptera within one week of the best season, at first glimpse not an extraordinary result as our survey only covers about 15 % of the roughly 2600 Macedonian species. Other researchers have e.g. found about 60 % of the butterflies known in the Republic of Macedonia within one week (Verovnik et al. 2010). However, in contrast to the last mentioned study our research activities concentrated on a small area of the country and furthermore results suffered from bad weather conditions with several thunderstorms, strong wind and low temperatures. Under such circumstances the number of 48 new country records is extraordinary and gives clear evidence to considerable gaps in faunistic research. Though the number of new taxa is largely based on Fauna Europaea and hence few records may have been published in "hidden" literature the lacks of faunistic data in this part of Macedonia are obvious. Several taxa are small and difficult to observe and to identify which may be one of the reasons for long-lasting neglect. However, though the majority of new records belong to various families of "Microlepidoptera", we also found a considerable amount of so-called Macrolepidoptera not yet known (or published) from the country. Among these 12 species some are externally striking such

as *Autographa aemula* and *A. bractea* and should not have been overlooked in other and better surveyed areas. It seems therefore very likely that most of these taxa only have a limited distribution in Macedonia with a restriction to mountain habitats. Of particular interest are the few highly isolated populations of species not yet known from the entire Balkan Peninsula, among them *Mompha sturnipennella*, *Epilobophora sabinata* and *Autographa aemula*.

The faunistic survey doubles not only the number of species known from the National Park (Krpač & Lazarevska, 2008; Krpač, 2010) so far but includes some biogeographically most interesting taxa. Endemic species of the Balkans are e.g. *Infurcitinea albanica*, *Rhigognostis wolfschlaegeri*, *Megacraspedus incertellus*, *Acompsia ponomarenkoae*, *Catoptria acutangulella*, *Catoptria kasyi* and *Charissa certhiatus* but also at least two relict arctic-alpine species were recorded (*Macaria fusca*, *Erebia pandrose*).

A particular striking result of our survey is the discovery of maybe 4 species new to science. Though these results are preliminary, a careful check of genitalia morphology and external appearance makes it very likely that two species of *Dichrorampha* (Tortricidae), one *Plutella* sp. and one *Exaeretia* sp. are still undescribed whereas few species of *Elachista*, *Dahlica*, *Coleophora* and *Eucosma* have not been identified due to lack of concise identification literature.

Acknowledgments

we thank the authorities of the Ministry of Environment and Physical planning who gave us the permits to visit the Korab area in the Mavrovo National Park and furthermore the staff of the protected area for kind support. For important help we thank the Austrian Embassy in Skopje, especially his Excellency Ambassador Dr Alois Kraut. Moreover, we thank the director of the Macedonian Museum of Natural History in Skopje, Ismet Mehmeti, for his friendly support of our expedition. Mr Bernhard Tarmann (Völs, Austria) is thanked for sponsoring the expedition by the loan of his Landrover Defender that enabled us to carry heavy equipment into the mountains.
