PARDEAFTARCHES

The Portuguele being better warriors than philosophers, and

THE island of Sumatra, which, in point of situation and extent, holds a contpicuous rank on the terraqueous globe, and is furpatfed by few in the bountiful indulgences of nature, has in all ages been unaccountably neglected by writers; infomuch that it is at this day less known, as to the interior parts more especially, than the remotest island of modern discovery; although it has been constantly resorted to by Europeans, for some centuries, and the English have had a regular establishment there, for the last hundred years. It is true that the commercial importance of Sumatra has much declined. It is no longer the Emporium of Eastern riches, whither the traders of the West reforted with their cargoes, to exchange them for the precious merchandize of the Indian Archipelago: nor does it boaft now the political consequence it acquired, when the rapid progress of the Portuguese successes there first received a check. That enterprizing people who caused so many kingdoms to thrink from the terror of their arms, met with nothing but difgrace in their attempts against Acheen, whose monarchs made them tremble intheir turns. Yet still the importance of this island, in the eye of the natural historian, has continued undiminished, and has equally at all periods, laid claim to an attention, that does not appear, at any, to have been paid to it.

b

The

The Portuguese being better warriors than philosophers, and more eager to conquer nations, than to explore their manners or antiquities, it is not furprizing that they should have been unable to furnish the world with any particular and just description of a country, which they must have regarded with an evil eye. The Dutch were the next people from whom we had a right to expect information. They had an early intercourse with the island, and have at different times formed fettlements in almost every part of it; but they are filent with respect to its history. This might perhaps be popularly accounted for, from the supposed hebitude of their national character, or their attachment to gain, which is apt to divert the mind from all liberal pursuits. But I believe the true reason is to be found, in the jealous policy of their commercial fystem, which deems it matter of expediency to prohibit the publication of any refearches, that might tend to throw a light on the fources of their profit, and draw the attention of the rest of the world. But to what cause are we to ascribe the remissiness of our own countrymen, whose opportunities have been equal to those of their predecessors or cotemporaries? It seems difficult to account for it, but the fact is, that, except a short sketch of the manners prevailing in a particular district of the island, published in the Philosophical Transactions of the year 1778, not one page of information respecting the inhabitants of Sumatra, has been communicated to the public, by any Englishman who has refided there.

To form a general and tolerably accurate account of this country and its inhabitants, is a work attended with great and peculiar difficulties. The necessary information is not to be procucured from the people themselves, whose knowledge and enquiries are to the last degree confined, scarcely extending beyond the bounds of the district where they first drew breath: and but very rarely have the almost impervious woods of Sumatra been penetrated, to any confiderable distance from the sea coast, by Europeans; whose observations have been then imperfect; trusted perhaps to memory only; or if committed to paper, lost to the world by their deaths. Other difficulties arise from the extraordinary diversity of national distinctions, which, under a great variety of independent governments, divide this island in many directions; and yet not from their number merely, nor from the diffimilarity in their languages or manners does the embarraffment entirely proceed: the local divisions are perplexed and uncertain; the extent of jurisdiction of the various potentates is inaccurately defined; fettlers from different countries, and at different periods, have introduced an irregular, though powerful influence, that superfedes in some places the authority of the established governments, and imposes a real dominion on the natives, where a nominal one is not assumed. This, in a course of years, is productive of innovations that destroy the originality and genuineness of their customs and manners, obliterate ancient distinctions, and render confused the path of an investigator.

Thefe

These objections, which seem to have hitherto proved unfurmountable with fuch as might have been inclined to attempt an history on Sumatra, would also have deterred me from an undertaking apparently fo arduous; had I not reflected, that those circumstances in which consisted the principal difficulty, were in fact the least interesting to the public, and of the least utility in themselves. It is of but small importance, the determining with precision, whether a few villages on this or that particular river, belong to one petty chief or to another; whether fuch a nation is divided into a greater or leffer number of tribes: or which of two neighbouring powers originally did homage to the other for it's title. History is only to be prized, as it tends to improve our knowledge of mankind, to which fuch inveftigations contribute in a very small degree. I have therefore attempted rather to give a comprehensive, than a circumftantial description of the divisions of the country into it's various governments; aiming at a more particular detail, in what respects the customs, opinions, arts, and industry of the original inhabitants, in their most genuine state. The interests of the European powers who have established themselves on the island; the history of their fettlements, and of the revolutions of their commerce, I have not considered as forming a part of my plan; but those subjects, as connected with the accounts of the native inhabitants, and the history of their governments, are occasionally introduced.

I was principally encouraged to this undertaking by the promifes of affiftance I received from fome ingenious, and very highly efteemed friends, who resided with me on Sumatra. It has also been urged to me here in England, that as the subject is altogether new, it is a duty incumbent on me, to lay the information I am in possession of, however defective, before the public, who will not object to it's being circumfcribed, whilst it's authenticity remains unimpeachable. This last quality is that which I can with the most confidence take upon me to vouch for. The greatest portion of what I have described, has fallen within the scope of my own immediate observation; the remainder is either matter of common notoriety to every person residing on the island, or received upon the concurring authority of gentlemen, whose fituation in the East India Company's fervice; long acquaintance with the natives; extensive knowledge of their language, ideas, and manners; and respectability of character, render them worthy of the most implicit faith that can be given to human testimony.

I have been the more fcrupulously exact in this particular, because my view was not, ultimately, to write an entertaining book, to which the marvellous might be thought not a little to contribute, but sincerely and conscientiously to add the small portion in my power, to the general knowledge of the age; to throw some glimmering light on the path of the naturalist; and more especially to surnish those philosophers, whose labors have been directed to the investigation of the history of Man, with facts to ferve as data in their reasonings, which are too often rendered nugatory, and not seldom ridiculous, by assuming as truths, the misconceptions, or wilful impositions of travellers. The study of their own species is doubtless the most interesting and important that can claim the attention of mankind; and this science, like all others, it is impossible to improve by abstract speculation merely. A regular series of authenticated facts, is what alone can enable us to rise towards a perfect knowledge in it. To have added one new and firm step in this arduous ascent, is a merit I should be proud to boast of.

metter of commun notoricty to every performedding on the identity of genderace, whole or received upon the communing authority of genderace, whole fittention in the East India Company's fervice; long acquaintance with the natives; ententive knowledge of their language, ideas, and manners; and refordability of churafter, render them worthly of the most implicit faith, that can be given to human testimously.

I have been the more ferupoloufly exact in this particular, because my view was not, tillimately, to write an entertaining book, to which the marvellous might be thought not a little to contri-

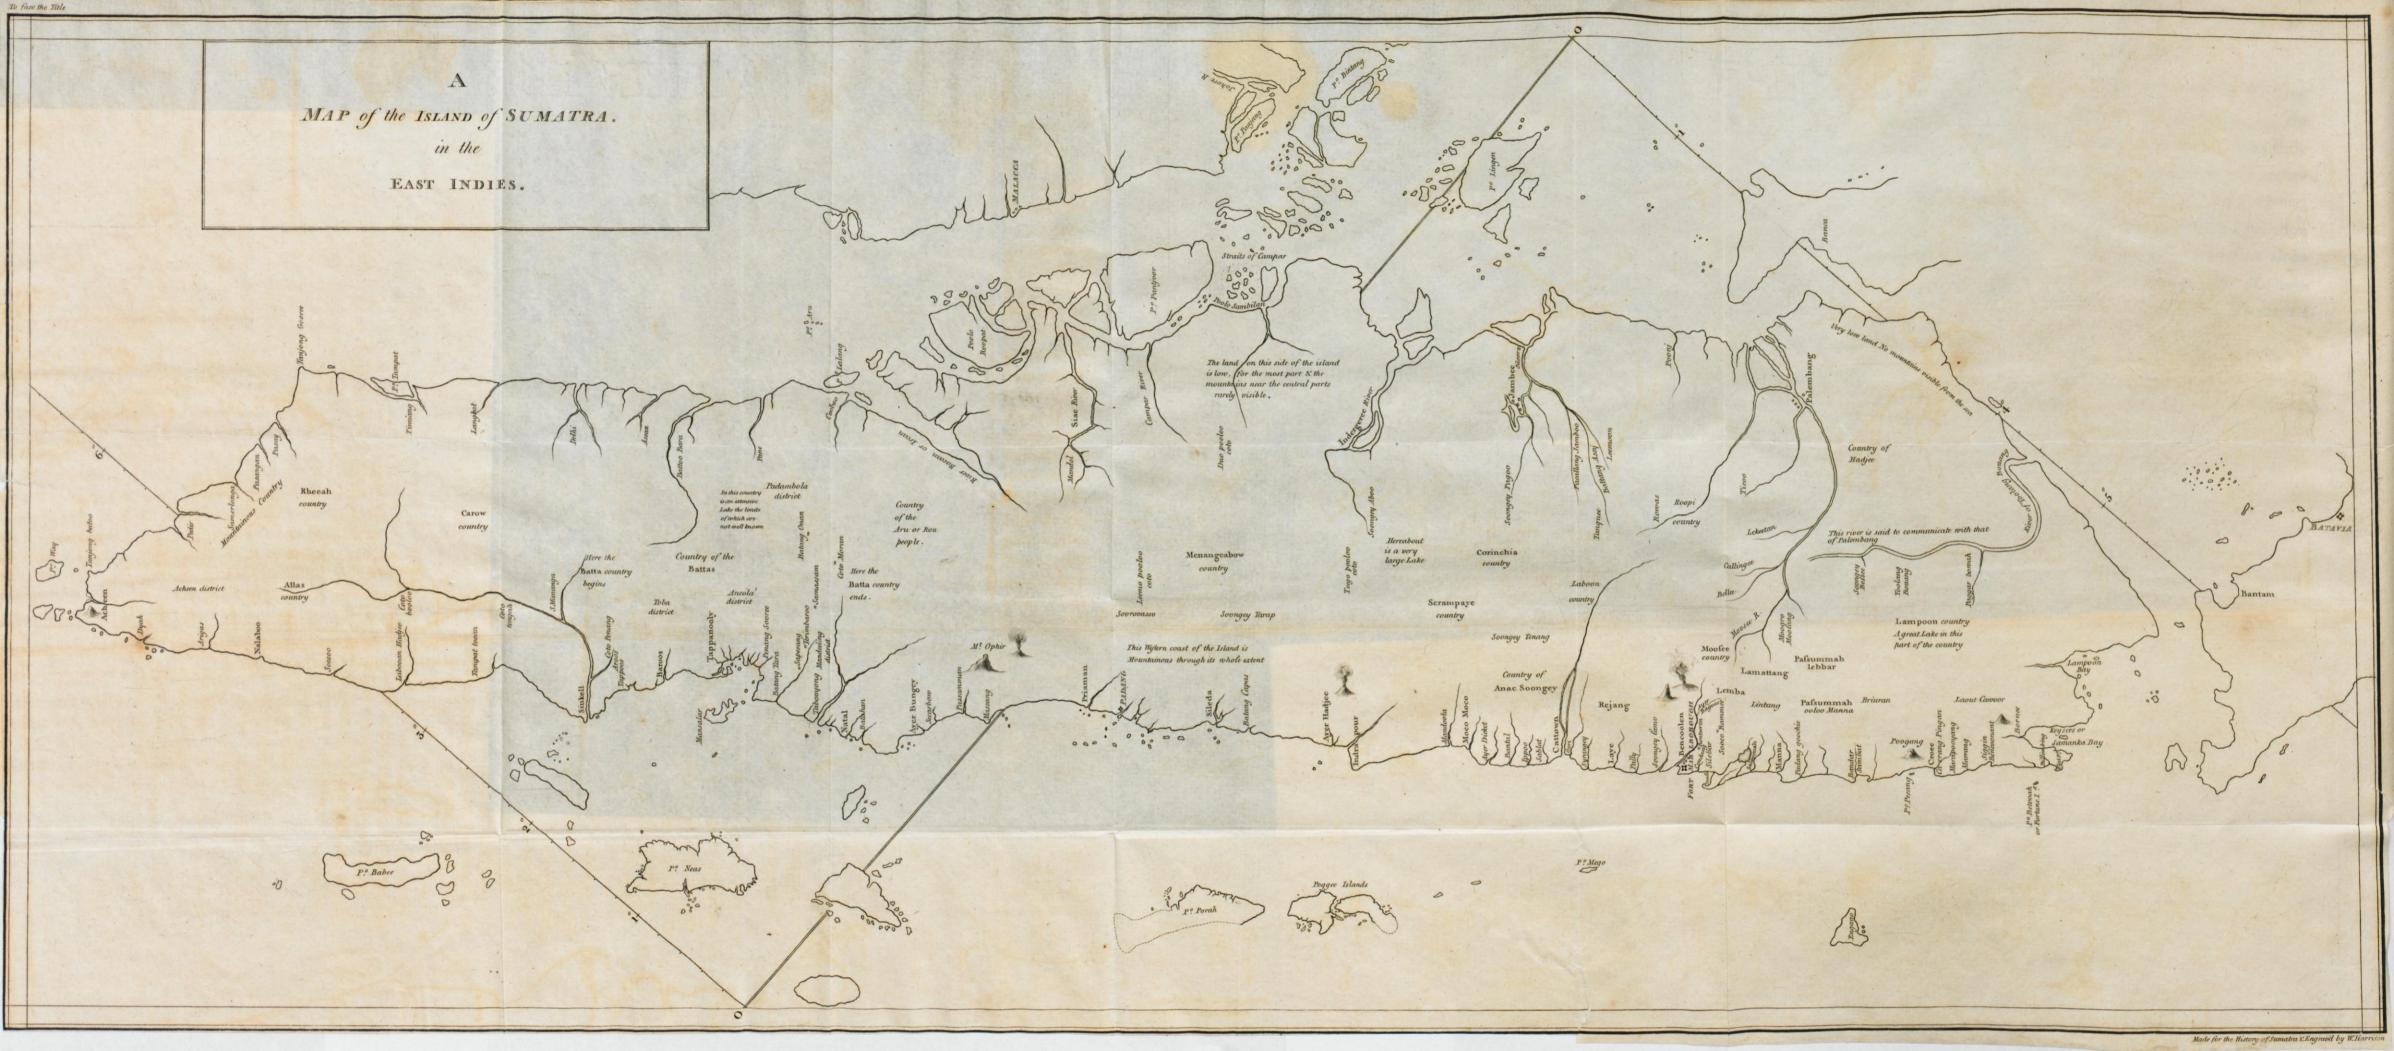

base, but fineerely and confidenticutly to add the finall portion in

my power, to the general knowledge of the age; to throw fome glammering light on the path of the naturality and more efficient

cially to furnific those philosophers, whose labors have been di-

othed to the investigation of the history of Man, with facts to

HISTORY

presentions of any particular ifland to that calchrated name.

If antiquity holds up to us some models, in different arts and sciences, which have been sound inimitable; the moderns, on the other hand, have carried their inventions and improvements, in a variety of instances, to an extent and a degree of perfection, which the former could entertain no conception of. Among those discoveries in which we have stepped to rar beyond our masters, there is none more striking, or more eminently useful, than the means which the ingenuity of some and the experience of others, have taught mankind, of determining with certainty and precision the relative situation of the various countries of the earth. What was formerly the subject of mere conjecture, or at best of vague and arbitrary computation, is now the clear result of settled rule, sounded upon principles demonstratively just. It only remains for the liberality of princes and states, and the persevering industry of navigators and travellers, to effect the application of these means to their proper end, by continuing to ascertain the unknown and uncertain positions of all the

B

parts of the world, which the barriers of nature will allow the skill and industry of man to approach.

Sumatra un known to the ancients.

Ceylon probably their Taprobane.

The extensive and obviously situated island, which is the subject of the prefent work, feems, notwithstanding some obscure and felf contradictory paffages of Ptolomey and Pliny, to have been utterly unknown to the Greek or Roman geographers, whose discoveries, or conjectures rather, carried them no farther than Ceylon; which with more shadow of probability, was their Taprobane, than Sumatra, although that name, during the middle ages, was uniformly applied to the latter island. Whether, in fact, the appellation of Taprobane, as introduced by the ancients, belonged to any place really existing, affords fome room to be fceptical. Observing that a number of commodities, not produced in Europe, came from an island or islands in the supposed extremity of the east, whose situation they were ignorant of, they possibly might have placed in their charts, one of ample extent, which should stand as the arbitrary representative of the whole. This supposition cuts short the various arguments that have been adduced by different writers, in fupport of the pretenfions of any particular island to that celebrated name. The idea of Sumatra being the country of Ophir, whither Solomon fent his fleets, is too vague, and the fubject wrapt in a veil of too remote antiquity, to merit discussion.* In times much later, the indentity of Sumatra, as described, or alluded to by travellers, appears not a little equivocal. The Arab travellers who, about the year 1173, penetrated into India and China, speak of an island which they call Ramai, whose description coinciding tolerably with the real fituation and productions of Sumatra, allows us to conclude, that it was it they defigned. Marco Paulo, the famous Venetian traveller; whose writings published in 1269, though long condemned as idle tales, have many internal marks of authenticity; describes an island which he calls Java Minor, that appears, on attentive perufal of ill fpelt names, and more especially of some

Called Ramni by Arab travellers.

Java Minor by Marco Paulo.

^{*} A mountain in Sumatra is called by the name of Ophir; but this has been given to it by Auropeans in modern days, resont but awoming out nintrolls of gaining firiking

firiking particulars in the manners of the people, to be no other than Sumatra; as I think will appear to any investigator who is acquainted with the country.*

At length the Portuguese expedition in the eastern seas, made this Indentity deisland known to the rest of the world, pointing out its situation and character, with as much accuracy as secended their other discoveries; + and which the experience of later ages has determined with more precision, as follows.

Situation

Sumatra is an island in the East Indies; the most western of those claffed by geographers under the diffinction of Sunda islands, and constitutes, on that fide, the boundary of the eastern Archipelago. It's general direction is nearly north west and south east. The equator bifects it in almost equal parts, the one extremity being in five degrees thirty three minutes, north, and the other, in five degrees fifty fix minutes fouth latitude. Fort Marlborough, or Oojong Carrang, in latitude three degrees forty fix minutes, fouth, the only point whose longitude has been determined by actual observation, is found to lie one hundred and two degrees east of Greenwich; but the situation of Acheen Head also, is pretty accurately fixed by computation, at ninety five degrees, thirty four minutes; and the longitudes in the Straits of Sunda are well ascertained, by the short runs from Batavia, which city has the advantage of an observatory. Sumatra hes exposed on the fouth wen nde to the great Indian Ocean; the north point stretches into the Bay of Bengal; to the north east, it is divided from the Peninsula of Malayo, by the Straits of Malacca; to the east, by the Straits of Banca, from the island of that name; to the fouth east, by the com-

^{*} Occasion will be taken in the sequel, to examine into the authenticity of this curious, but obscure author's relation.

[†] See Oforius : Maffeus : De Barros.

[†] Preparatory to an observation of the transit of the planet Venus over the sun's disc, in June 1769, Mr. Robert Nairne determined the longitude of Fort Marlborough, by eclipses of Jupiter's fatellites, to be 1010.42'.45" east from London; which was afterwards corrected by the Aftronomer Royal to 1020,

mencement of what are called the China Seas; and on the fouth it is bounded by the Straits of Sunda, which separate it from the island of Java.*

Name.

The name of "Sumatra", by which this island has been called in latter times, being unknown to the natives; who indeed are ignorant that it is an island, and have no general name whatever for it; I have been led to take much trouble, and to purfue a more laborious investigation than the importance of the object demanded, in order to deduce the origin of the appellation, or to learn, from whom the Portuguese, who in their earliest writings call it nearly by that name, adopted it, in place of the more ancient one of Taprobane. It has by them, and the voyagers of other nations, been fucceffively spelt, Samoterra, Samotra, C, amatra, Zamatra, Zamara, Sumotra, Sasnotra, Somatra, Samatra, and laftly Sumatra. I must acknowledge that in the event of my research, I obtained but little fatisfaction, unless it may be esteemed such, to have perceived that feveral others had attempted it with the fame fuccefs. The Arabians, who before the Portuguese, were the greatest navigators of the Indian seas, appear to have distinguished it by the various names of Alrami, Rami, or Ramni, Lameri, Sobarmah, or Sobormah, Samandar, and Azebain, or Azebani; or else these names belong to different islands in that part of the world, which from their fimilarity of productions, and vicinity of fituation, are confounded together. Samander bears fome refemblance to the modern name, but it is described by the Nubian geographer, Edress, as lying near to the river Ganges. The Africans are faid to call it Achamba. Monfieur D'Anville, whose authority should be of considerable weight, if the subject was not so very obscure. is confident that the Jabadii infula of Ptolomey, is Sumatra, though

^{*} A tradition, taken notice of by feveral writers, prevailed, that Sumatra was anciently a part of the continent of Asia. Maffeus says, "Ea infula, a septentrione in austrum oblique porrecta, ab continente, in qua Malacca urbs est, angusto et periculoso dividitur mari; atque ob id ipsum, peninsula quondam credita est." John de Barros likewise speaks of Sumatra, as what the ancient geographers called the Aprea Chersonesus; thinking it to be a continuation of the continent.

usually supposed to represent Java. The commentators of Arrian affert that this island is designed by the infula Simundi, vel Palasimundi of that writer, in his periplus mari Erythræi. Odoricus, a friar, who in the year 1331 vifited some of the Indian islands, speaks of Java and Symolta which name feems a kind of middle term between that given it by Arrian and the modern one of Sumatra, and may possibly be the true etymology. Relandus, an able investigator of eastern antiquities, fays that it is called Sumatra, from a certain high land named "Samadra", which he supposes to fignify, in the language of the country, "magna formica"; but though there is no fearcity of large ants in the island, it is certain that they are never called by that name; it is nearly as certain that there is no remarkable hill there bearing the appellation he mentions; nor does the derivation either carry the appearance of probability, or any corroborating testimony in its favour. He mentions likewise; and in this he is supported by the Dutch writers, that the people of the neighbouring iflands, call it Indalas (Andeelees), which holds good of the Javans, but has no extensive acceptance, and the natives themselves, as before remarked, are ignorant of fuch a name; as well as of every other. This is a point which I took pains to investigate, and which I can pronounce upon with certainty; and to this circumstance principally the ambiguity respecting its ancient title is owing: as navigators of different nations had no common and permanent standard to refer to, each who vifited it bestowed an arbitrary appellation, which subsequent travellers misapplied and confounded*. What seems pretty evident is, that the name, however derived, was learned by the Portuguese on the coast of Malabar, where they made their first establishments, and required a knowledge of the more eastern countries; very rude indeed at the earlier period, as appears by the Itinerarium Portugalenfium, pub-

^{*} Much inconvenience is experienced by navigators in modern times, from the arbitary mode of bestowing names on land newly discovered or explored. That name which the inhabitants, or those of the neighbouring countries, distinguish a place by, should ever be scrupulously preferved; if such can be ascertained. This seems to have been first attended to by Mr. Dalrymple, and since by Captain Cooke.

lished in the year that their sirst expedition to Sumatra was sitted out; in which Cataia, or China, is described as an island*.

stamue in his propers man dependent Outerang a year 1331 winted fome of the Indian illends, speaks of

* For the gratification of the curious reader, I shall subjoin the following extracts, relative to the ancient name of Sumatra, from those authorities which I have had occasion to consult in the course of my investigation of that subject.

Voyage of Arabs to India and China, 1173. " An eaftern island called Ramni: governed by many kings: eight or nine hundred leagues in length: gold mines: camphire: many islands near it; one of the largest called El nian (qu: Neas): use coconut oil: have many elephants; fapan wood: eat human flesh."-Herbelot. Bibliothique orientale, 1697. " Sobarmah or Sobarmab, an Island in the Chinese Sea, about which are many small ones uninhabited. Sea very tempestuous. Soundings generally forty fathoms. Scheriff Al Edressi writes, in the tenth part of his first climate, that the best camphire of the east is collected here. This isle is most probably Sumatra; the Arabians calling all that fea and land which is to the eastward of Cape Comorin, the fea and land of China. Some geographers remark that the greatest quantity of wood aloes comes from the ifle of Semender, which may be what we call Sumatra. Rami; a rich country, bearing the tree called Bacam by the Arabs, and by us Basil wood (sappan), and where you find the animal which the Arabs and Persians name Kerkedan, (rhinoceros); is an island seven hundred Jeagues in length, and distant about three days fail from Screndib, which we believe to be Zeilan. Dib or div, in the Indian language, fignifies an island. Edreffi fays that the Chinese used to carry on a great traffic to Seremdib"-There is reason to doubt their having ever passed Acheen-In the geographia Nubienfis (quoted by Herbelot), the island called Alrami feems to answer best to Sumatra, except in its proximity to Serendib, being ten days fail instead of three. Sabormab has the next claim; and laftly Samandar, which though the nearest in name, scarcely agrees at all in fituation, being faid to lie near the Ganges-Jones, Description of Asia, 1773. Farther eastward are the islands of Samandar; Rami or Lameri, which may, perhaps, be Java, though, by the accounts of it, one would take it for the fame with Samander; and then Albinoman will be Java, and Mehrage or Sobormab, Borneo"-Marco Paulo, 1269. " Beyond Petan, fleering towards the fouth, at the diffance of thirty three leagues, is Java Minor"-the difcription of which answers to Sumatra .- Odoricus, as mentioned in Hackluit, t. 2. p. 45. " In the year 1331, Odoricus, a friar, was in Java: the first European that peirced into India and returned". (Marco Paulo an exception)-Herbert. Oderic calls Sumatra, Symolta-Mandeville, 3400. " Befide the ysle of Lemery is another that is clept Sumobor; and fast beside, a great ysle clept Java"-Nicoli de Conti. 1449. Ramusio gives a good account of Sumatra under the name of Taprobane, and particularly mentions fome extraordinary customs, now well ascertained, of the Batta people-Itinerarium Portugallenfium in Indiam, printed 1508, but written, apparently, some years sooner. " Lacham mittit oppidum dictum Samoterra, ultra Calechut leucis cccc". Præteria in hoc mari Indico complures infulæ vifuntur, et inter alias duæ funt quæ cæteras omni rerum celebritate præstant. - Altera Sayla dicitur, qua abest ab dicto capite Comar M prope c c-Post hanc, ad orientem, altera visitur quæ dicitur Samotra, nos Taprobanum appellamus, quæ abest ab urbe Calechut itinere trium mensium. Ultra eam est Cataium feracissima, ut dictum

Sumatra is one of the largest islands in the world, but its breadth is Size determined with so little accuracy, that any attempt to calculate its superfices

dictum est, infula" .- Ludovicus Vertomanus, 1504. (There is reason to think this date too early) Printed 1535. " Pyder the most famous part of Sumarra or Taprobana"-Old map and defcription of Sumatra or Taprobana, by a French Captain; without date; but appears to have been written not many years after the first Portuguese voyages. Preserved in Ramusio, vol. 3-In a letter from Emanuel king of Portugal to Pope Leo the tenth, dated 1513 (preferved in the Novus Orbis Historicus) he mentions the discovery of Zamatra by his subjects-Epistola di Massimiliano Transylvano, 1519. "Hanno navigato all'ifola detta di gli antichi Taprobana, la qual adeffo fi chiama (Zamara) Sumatra; purche dove Tolomeo et Plinio et altri cosmographi han misso la Taprobana, non è ifola alcuna, chi fi poffa credere effer quello"-Ludovico Barthuma, 1519 (Ramufio) fpeaks of Sumotra - Sebastianus Munsterus. Printed 1537. " Circa littora Taphrophanæ, quam hodie Sumatram vocant."-Cofmographie Univ. de A Thevet, 1541. " Near the point of Malacca is Taprobane or Sumathre, which the barbarians formerly called Salique: (mistake for Ceylon): the Arabs named it Azebain, and the Africans, Achamba. Famous for cinnemon. Kings of Pazar (Pafay), Dardgni (perhaps Andergery), Pedir, Ham and Biranc, tributary to the grand Cam. Many fpices here, but the pepper comes from Calcout and Zeilan. Governed by many petty kings. In 1543 it was plundered and ravaged by some adventurers from Cephala. Dress of the people well described. The equinoctial passes through the middle of the island"-Mendez de Pinto, 1558. "In 1539 the Portuguese governor of Malacca received an embaffy from the king of the Batas, in the ifland of Samatra—Geography of Ptolomey translated into Italian by Geralimo Ruscelli. Printed 1361. Taprobana; where the people, according to Ptolomey, have the fun exactly over their heads, and fometimes north, fometimes fouth of them; we call Samotra or Sumatra. Its four kings pay tribute to the Cham of Tartary"-Scolia J. G. Stukii, in periplum Arriani, 1577. "Taprobane olim, tefte Arriano nostro necnon Ptolomeo, Simundi infula fuit appellata. Hanc plerique doctorum volunt effe infulam hodie Sumatram, sive Samatran, sive Zamatran dictam."-Cosmographie de P. Appian par Gemma Frison, 1581. "Taprobana, ille autrefois nomme Simundi, et maintenant, felon aucuns, Sumatra. Ptolomé recite que'lle estoit paravant dicte Simonide, & que les peuples d'icelle s'appelloyent d'un commun nom, Salas, & qu'ils portoyent tous habitz de femmes."-Oforius. Translation, 1581. "With these five ships he (Sequeria) failed to the island formerly named Taprobane, and now Zamatra"-Maffeus, Hift. Indic. Printed 1590. Sequeria ad Somatrum primus omnium Lufitanorum accessit".- John de Barros, 1628. Malacca had the epithet of aurea given to it, on account of the abundance of gold carried thither from Monancabo and Barros, countries in the island C, amatra. At the time of our coming into India, the sea coast was divided into twenty kingdoms. Beginning at the most western point, and thence going round by the north, the first is called Daya; and those which follow in order, are, Lambrij, Achem, Biar, Pedir, Lide, Pirada, Pacem, Bara, Daru, Arcat, Ircan, Rupat, Purij, Ciaca, Campar, Capocam, Angraguerij, Jambij, Palimbam, Tanna Malayo, Sacampam, Tulumbaum, Andoliz, Piriaman, Tico, Barros, Quinchel and Mancopa, which is in the neighbourhood of Daya and Lambrij beforementioned. Vincent le Blanc. Printed 1660. "Sumatra, called by fome Tafan, which fignifies a great Island.

perfices, must be liable to very confiderable error. Like Great Britain, it is broadest at the southern extremity, narrowing gradually to the north; and to this island it is perhaps in size, more nearly allied than in shape.

Mountains

A chain of high mountains runs through its whole extent, the ranges being in many parts double and treble, but fituated, in general, nearer to the western than the opposite coast; being, on the former, seldom so much as twenty miles from the sea. The altitude of these mountains, though very great, is not sufficient to occasion their being covered with snow, during any part of the year, as those in South America, between the tropics, are found to be. Mount Ophir, situated immediately under the equinoctial line, is supposed to be the highest visible from the sea, its summit being elevated thirteen thousand eight hundred and forty two seet above that level; which is no more than two thirds of the height the French astronomers have ascribed to the lostiest of the Andes, but somewhat exceeds that of the Peak of Tenerisse.* Between

Island. Inhabitants of Malacca fay it was formerly joined to the continent, but separated by an earthquake."—Herbert's Travels. Printed 1677. Oderic call Sumatra, Symolta; Josephus, Samotra; others, Alramis and Zamara. Symunda in Plotomey; by the inhabitants Salyca and Salutra. Mediterranean Town Manancabo, formerly called Syndo canda."—Richshoffer, Voyages in German, 1667. Sumatra is spelt Sammater.—Dampier, 1688. This circumnavigator mentions having seen an old map, in which there was no other name to Sumatra, but that of Sheba.—Relandus. "Indalus. Ita appellatur incolis & vicinis, infula illa quæ nune vulgo Sumatra, a loco quodam excelso in ea infula dicto Samadra, i. e. magna formica."—I have been chiefly enabled to obtain the foregoing extracts; many of them from very scarce authors; and others that will occur in the subsequent part of the work, by recourse to the valuable collection of voyages and travels, (perhaps unequalled in any library in Europe), formed by, and in the possession of Alexander Dalrymple, Esq.

Some persons have imagined that they find an easy derivation of the name of Sumatra, or Samatra, from a word so spelt, signifying a " squall" in the Portuguese and Spanish languages: but the fact is just the reverse. Sailors finding such squalls to prevail in the neighbourhood of that island, naturally called them after its name; and even the English call them Sumatras; as they say a Scotch Miss.

^{*} The following is the refult of observations made by Mr. Robert Narine, of the height of Mount Ophir.

these ridges of mountains, are extensive plains, considerably elevated above the furface of the maritime lands; where the air is cool; and from this advantage they are esteemed the most eligible portion of the country, are consequently the best inhabited, and the most cleared from woods, which elfewhere in general throughout Sumatra, cover both Woods. hills and valleys with an eternal shade. Here too are found many large and beautiful lakes that extend, at intervals, through the heart of the Lakes. country, and facilitate much the communication between the different parts; but their dementions, fituation, or direction are very little known, though the natives make frequent mention of them in the accounts of their journeys. These give birth to most of the larger rivers, and particularly to those which empty themselves to the eastward. Waterfalls and cascades are not uncommon, as may be supposed, Waterfalls. in a country of fo uneven a furface. A remarkable one descends from

the north fide of Mount Poogong, near Poolo Pifang. Manselar, which forms the mouth of Tappanooly Bay, prefents to the view a fall, of very fingular appearance, from the fummit of a fugar loaf mountain; the refervoir of which, the natives plaufibly affert to be a huge shell of the fpecies called Keemo*. A small but beautiful cascade descends perpendicularly from the steep cliff, which, like an immense rampart lines the fea shore near Manna. No country in the world perhaps is better watered than this. Springs are found wherever they are fought Rivers. for. The rivers on the western coast are innumerable, but they are in general too small and rapid for the purpose of navigation. The vicinity of the mountains to that fide of the island, occasions this profusion of rivulets, and at the fame time the imperfections that attend them, by not allowing them space to accumulate to any considerable fize. On the eastern coast, the distance of the range of hills not only affords a larger scope for the course of the rivers, before they disembogue; presents a greater furface for the receptacle of rain and vapors, and enables them to unite a greater number of fubfidiary ftreams; but also renders the flux more fleady and uniform, by the extent of level space; than where the torrent rolls more immediately from the mountains. But it is not to be understood that on the western side there are no large rivers. Cattown, Indrapour, Tabooyong and Sinkell have a claim to that title, although inferior in fize to Palembang, Jambee, Indergeree, Racan, and Battoo Barroo. The latter derive also a material advantage from the shelter given them by the peninfula of Malacca, and Borneo, Banca and the other islands of the Archipelago, which breaking the force of the fea, prevent the furf from throwing up those banks of fand that choke the entrance

^{*} The keemo shell; probably the largest in the world; is of the cockle kind: it is found in the Bay of Tappanooly chiefly: they are taken in deep water, by thrusting a long Bamboo between the valves as they lie open, and by the immediate closure which follows, it is made fast. I have been assured that the fish of one of them, with a proportionate quantity of rice, has served the crew of a country ship for one day's food. The largest I have seen was about three to four feet over. Captain Forest mentions their being found on the Coast of New Guinea. The shell is perfectly white, and is worked up like ivory by the natives.

[†] A ship from Europe (the Elgin) sent a boat, in order to procure fresh water there, attracted by its appearance from sea; but the boat was lost in the surf, and the crew drowned.

of the fouth western rivers, and render them impracticable to boats of any draught of water. These labor too under this additional inconvenience; that scarce any, except the largest, run out to sea in a direct courfe. The continual action of the furf, more powerful than the ordinary force of the stream, throws up at their mouths a bank of fand, which diverts their course to a direction parallel with the shore, between the cliffs and the beach, till the accumulated waters at length force their way wherever there is found the weakest refistance.* In the southerly Monfoon, when the furfe are usually highest, and the rivers, from the drynefs of the weather, least rapid, this parallel course is at the greatest extent; but as the rivers fwell with the rain, they gradually remove obstructions and recover their natural channel.

which it uffully sending in paffine over laine

The heat of the air is by no means fo intense as might be expected, Air. in a country occupying the middle of the torrid zone. It is more temperate than in many regions without the tropics, the thermometer, at the most fultry hour, which is about two in the afternoon, generally fluctuating between 82 and 85 degrees. I do not recollect to have ever feen it higher than 86 in the shade. At sun rise it is usually as low as 70; the fenfation of cold, however, is much greater than this would feem to indicate, as it occasions shivering and a chattering of the teeth; doubtless from the greater relaxation of the body, and openness of the pores in that climate; for the same temperature in England would be esteemed a confiderable degree of warmth. These observations on the state of the air, apply only to the districts near the sea coast, where, from their comparatively low fituation, and the greater compression of the atmosphere, the fun's rays operate more powerfully. Inland, as the country afcends, the degree of heat decreases rapidly, infomuch, that beyond the first range of hills, the inhabitants find it expedient to light fires in the morning, and continue them till the day is advanced, for the purpose of

warming

¹ Moco Moco river takes a course, at times, of three miles, in this manner, before it mixes with the fea.

[#] At Calcutta in Bengal, the thermometer, in the hot feason, rises to 93°. up the country fometimes to 1010, in the shade; and even after sun set, it has been observed at 96°.

warming themselves; a practice unknown in the other parts of the island. To the cold also they attribute the backwardness in growth of the coco-nut tree, which is fometimes twenty or thirty years in coming to perfection, and often fails to produce fruit. Situations are uniformly colder in proportion to their height above the level of the fea, unless where local circumstances, such as the neighbourhood of fandy plains, contribute to produce a contrary effect; but on Sumatra the coolness of the air is promoted by the quality of the foil, which is clayey, and the conftant and ftrong verdure that prevails, which, by absorbing the fun's rays, prevents the effect of their reflection and refraction. The circumftance of the island being so narrow contributes also to its general temperateness, as wind directly, or recently from the sea is never possessed of any violent degree of heat; which it usually acquires in paffing over large tracts of land in the tropical climates. Frost, snow and hail are totally unknown to the inhabitants*. The atmosphere is in common more cloudy than in Europe, which is fenfibly perceived, from the infrequency of clear star-light nights. It may proceed from the greater rarefaction of the air occasioning the clouds to descend lower and become more opake, or merely from the stronger heat exhaling from the land and fea, a thicker and more plentiful vapour. The fog, called caboot by the natives, which rifes every morning between the hills, is denfe to a furprizing degree; the extremities of it, even when near at hand, being perfectly defined; and it feldom is observed to disperse till about three hours after fun rife.

Waterfront,

That extraordinary phoenomenon; fo well known and accurately defcribed; the waterspout, frequently makes its appearance in these parts, and not seldom on shore. The largest and most distinct I had ever an opportunity of seeing, I met whilst on horseback. I was so near to it, that the inward gyration, as distinct from the volumn which sur-

rounded

⁺ The hill people in the country of Lampoon, speak of a peculiar kind of rain that falls there, which some have supposed to be what we call sleet; but the fact is not sufficiently established; and perhaps what the countrymen mean, is nothing more than the thick mists or clouds, that usually encompass the tops of high hills, precipitating in rain.

rounded it, was perfectly visible to me. It seemed to have taken its rise in Bencoolen Bay, its course tending in a direction from thence across the peninfula on which the fettlement of Fort Marlborough stands, but before it reached the sea on the other side, it vanished by degrees, without any confequent fall of water, or other destructive effect, collecting itself into the body of the cloud from which it depended.

tract the attention of persons long resident in the country. During the north west monsoon, the explosions are extremely violent; the forked lightning shoots in all directions, and the whole sky seems on fire; whilst the ground is agitated in a degree, little inferior to the motion of an earthquake. In the fouth east monfoon, the lightning is more constant, but the corufcations are less fierce or bright, and the thunder is scarcely audible. It would feem that the consequences of these awful meteors are not so fatal there as in Europe; few instances occurring of lives being lost, or buildings destroyed by the explosions, although electrical conductors

have never been employed. Perhaps the paucity of inhabitants, in proportion to the extent of country, and the unfubftantial materials of the houses, may contribute to this observation. I have seen some trees, however, that have been shattered on Sumatra by the action of lightning.

Thunder and lightning are there fo very frequent, as scarce to at- Thunder and Lightning.

The causes which produce a successive variety of seasons in the parts of Monsoonse the earth without the tropics, having no relation or respect to the region of the torrid zone, a different order takes place there, and the year is diffinguished into two divisions, usually called the rainy and dry monsoons,* from the weather peculiar to each. In the feveral parts of India these monfoons are governed by various particular laws, in regard to the time of their commencement, period of duration, circumstances attending their change, and direction of the prevailing wind, according to the nature and fituation of the lands and coasts where their influence is felt. The

^{*} The term " Monfoon," appears to be a corruption of the word " Moofeem," which, both in Arabic and Malay, fignifies a year. Taoun, another Malay word for feafon or year, respects their harvests.

farther peninfula of India, where the kingdom of Siam lies, experiences at the fame time the effects of opposite seasons, the western side, in the Bay of Bengal, being exposed for half the year to continual rains, whilst on the eastern side the finest weather is enjoyed; and so on the different coasts of Indostan, the monsoons exert their influence alternately; the one remaining serene and undisturbed, whilst the other is agitated by storms. Along the coast of Coromandel, the change, or breaking up of the monsoons, as it is called, seldom fails of being attended with the most violent gales of wind.

On the west coast of Sumatra, the S. E. monsoon or dry season, begins about May, and slackens in September: the N. W. monsoon begins about November, and the hard rains cease about March. The monsoons for the most part commence and leave off gradually there; the months of April and May, October and November, generally affording weather and winds variable and uncertain.

Caufe of the Monfoons.

The causes of these periodical winds have been particularly pointed out by several able writers, and their directions accounted for in the different parts of the globe where they prevail. I shall therefore just summarily mention, that the diurnal revolution of the earth from west to east, or the virtual receding of the fun in a contrary direction, would, if that luminary always remained in the equatorial figns, produce a general east wind, as the current of air naturally follows the rarefaction caufed in the atmosphere by its rays. But as the fun gradually changes his fituation, or declination, from north to fouth, and again from fouth to north, the current of air by the same law of nature, follows him likewise in this course, and acquires a motion compounded of these two directions, producing a north east wind, when he is to the fouthward of the line, and a fouth east when he is to the northward. But it also happens, as is proved by uniform experience, that the periodical winds are influenced in their course, by the direction of the coasts near which they blow, and incline to a parrallelism therewith; in consequence of which, the N. E. monfoon is changed to N. W. on the Sumatra coast, which has

that

that bearing nearly in its whole extent, and accordingly coincides with the direction of the S. E. monfoon, when that prevails. Whilst the fun is near the line, the winds are variable, nor is their direction fixed till he has advanced feveral degrees towards the tropic; and this is the cause that the monsoons usually set in, as I have observed, about May and November, instead of the equinoctial months.

Thus much is fufficient with regard to the periodical winds. I shall proceed to give an account of those distinguished by the appellation of land and sea breezes, which require from me a minuter investigation, Breezes. both because, as being more local, they more particularly belong to my subject, and that their nature has hitherto been less accurately treated of by naturalists. I fast now endeavour to apply the

In this island, as well as all other countries between the tropics, of any confiderable extent, the wind uniformly blows from the fea to the land, for a certain number of hours in the four and twenty, and then changes, and blows for about as many from the land to the fea: excepting only when the monfoon rages with remarkable violence, and even at fuch time the wind rarely fails to incline a few points, in compliance with the efforts of the subordinate cause, which has not power, under those circumftances, to produce an entire change. On the west coast of Sumatra, the fea breeze usually fets in; after an hour or two of calm; about ten in the forenoon, and continues till near fix in the evening. About feven, the land breeze comes off, and prevails through the night, till towards eight in the morning, when it gradually dies away.

These depend upon the same general principle that causes and regu- cause of the lates all other wind. Heat acting upon air rarefies it, by which it be- Breezes. comes specifically lighter, and mounts upward. The denser parts of the atmosphere, which furround that so rarefied, rush into the vacuity from their fuperior weight; endeavouring, as the laws of gravity require, to restore the equilibrium. Thus in the round buildings where the manufactory of glass is carried on, the heat of the furnace in the

center being intense, a violent current of air may be perceived to force its way in, through doors or crevices, on opposite sides of the house. As the general winds are caused by the direct influence of the fun's rays upon the atmosphere, that particular deviation of the current, distinguished by the name of land and sea breezes, is caused by the influence of his reflected rays, returned from the earth or fea on which they strike. The surface of the earth is more suddenly heated by the rays of the fun, than that of the fea, from its greater denfity and state of reft; confequently it reflects those rays sooner and with more power: but owing also to its density, the heat is more superficial than that imbibed by the fea, which gets more intimately warmed, by its transparency, and by its motion, continually prefenting a fresh surface to the fun. I shall now endeavour to apply these principles. By the time the rifing fun has afcended to the height of thirty or forty degrees above the horizon, the earth has acquired, and reflected on the body of air fituated over it, a degree of heat fufficient to rarefy it and destroy its equilibrium; in consequence of which, the body of air above the sea, not being equally, or scarce at all rarefied, rushes towards the land; and the fame causes operating so long as the fun continues above the horizon, a constant fea breeze, or current of air from sea to land, prevails during that time. From about an hour before fun fet, the furface of the earth begins to lose fast the heat it has acquired from the more perpendicular rays. That influence of course ceases, and a calm succeeds. The warmth imparted to the fea, not fo violent as that of the land, but more deeply imbibed, and confequently more permanent, now acts in turn, and by the rarefaction it causes, draws towards its region, the land air, grown cooler, more dense and heavy, which continues thus to flow back, till the earth, by a renovation of its heat in the morning, once more obtains. the ascendancy. Such is the general rule, conformable with experience. and founded, as it feems to me, in the laws of motion, and the nature of things. The following observations will serve to corroborate what I have advanced, and to throw additional light on the subject, for the information and guidance of any future investigator.

The periodical winds which are supposed to blow during fix months from the N. W. and as many from the S. E. rarely observe this regularity, except in the very heart of the monfoon; inclining, almost at all times, feveral points to feaward, and not unfrequently blowing from the S. W. or in a line perpendicular to the coast. This must be attributed to the influence of that principle which causes the land and sea winds, proving on these occasions more powerful than the principle of the periodical winds; which two always act at right angles with each other. If these were of equal power, the current of air would take a middle direction, and conftantly blow, on Sumatra, from the W. point, during one monfoon, and from the S. point during the other :- and as the influence of either is prevalent, the winds approach to a course perpendicular to, or parallel with the line of the Coast. The tendency of the land wind at night, has almost ever a correspondence with the sea wind of the preceding or following day; (except when a fqualt or other fudden alteration of weather, to which these climates are particularly liable, produces an irregularity); not blowing in a direction immediately opposite to it; which would be the case, if the former were, as some writers have supposed, merely the effect of the accumulation and redundance of the latter, without any positive cause; but forming an equal and contiguous angle, of which the coast is the common fide. Thus, if the coast be conceived to run N, and S, the same influence, or combination of influences, which produce a fea wind at N. W. produce a land wind at N. E. or adapting the case to Sumatra, which lies N. W. and S. E., a sea wind at S. is preceded or followed by a land wind at E. This remark must not be taken in too strict a sense, but only as the refult of general observation. If the land wind, in the course of the night, should draw round from E. to N. it would be looked upon as an infallible prognoftic of a W. or N. W. wind the next day. On this principle it is, that the natives foretell the direction of the wind, by the noise of the surf at night, which if heard from the northward, is esteemed the forerunner of a northerly wind, and vice versa. The quarter from which the noise is heard, depends upon the course of the land wind, which brings the found with it, and drowns it to leewardward—the land wind has a correspondence with the next day's sea wind—and thus the divination is accounted for.

The effect of the fea wind is not perceived to the distance of more than three or four leagues from the shore in common, and for the most part it is fainter in proportion to the distance. When it first sets in, it does not commence at the remoter extremity of its limits, but very near the shore, and gradually extends itself farther to sea, as the day advances; probably taking the longer or shorter course as the day is more or less hot. I have frequently observed the sails of ships, at the distance of sour, six or eight miles, quite becalmed, whilst a fresh sea breeze was at the time blowing upon the shore. In an hour afterwards they have selt its effect.

Paffing along the beach about fix o'clock in the evening, when the fea breeze is making its final efforts, I have perceived it blow with a confiderable degree of warmth; owing to the heat the fea had by that time acquired, which would foon begin to divert the current of air towards it, when it had first overcome the vis inertiæ, that preserves motion in a body after the impelling power has ceased to operate. I have likewise been sensible of a degree of warmth on passing, within two hours after sun set, to leeward of a lake of fresh water; which proves the affertion of water imbibing a more permanent heat than earth:—in the day-time the breeze would be rendered cool in crossing the same lake.

Approaching an island situated at a distance from any other land, I was struck with the appearance of the clouds, about nine in the morning, which then formed a perfect circle round it; the middle being a clear azure; and resembled what the painters call a Glory. This I account for from the reslected rays of the sun rarefying the atmosphere immediately over the island, and equally in all parts, which caused a conflux of the neighbouring air, and with it the circumjacent clouds. These last, tending uniformly to the center, compressed each other at a certain dis-

tance

tance from it, and like the stones in an arch of masonry, prevented each others nearer approach. That island however does not experience the viciffitude of land and fea breezes, being too small, and too lofty, and fituated in a latitude where the trade or perpetual winds prevail in their utmost force. In fandy countries the effect of the fun's rays penetrating deeply, a more permanent heat is produced, the confequence of which should be, the longer continuance of the sea breeze in the evening; and agreeably to this supposition I have been informed, that on the coast of Coromandel, it seldom dies away before ten at night. I shall only add on this subject, that the land wind on Sumatra is cold, chilly and damp; an exposure to it is therefore dangerous to the health, and fleeping in it, almost certain death.

The foil of Sumatra may be spoken of generally as a stiff, reddish clay, Soil. covered with a stratum or layer of black mould, of no considerable depth. From this there springs a strong and perpetual verdure, of rank grafs, brush wood, or timber trees, according as the country has remained a longer or shorter time undisturbed by the consequences of population, which being in most places extremely thin, it happens that at least three parts in four of the island, and to the fouthward a much greater proportion, is an impervious forest,

Along the western coast of the island, the low country, or space of Unevenness of land which extends from the fea shore to the foot of the mountains, is Surface. interfected and rendered uneven to a furprifing degree, by fwamps; whose irregular and winding course may in some places be traced in a continual chain for many miles, till they discharge themselves either into the fea, some neighbouring lake, or the fens that are so commonly found near the banks of the larger rivers, and receive their overflowings in the rainy monfoons. The fpots of land which these swamps encompass, become so many islands and peninsulas, sometimes slatted at top, and often mere ridges; having in some places a gentle declivity. and in others descending almost perpendicularly to the depth of an hundred feet. In few parts of the country of Bencoolen;

or of the northern diffricts adjacent to it, could a tolerably level space of four hundred yards square be marked out: about Soongeylamo in particular, there is not a plain to be met with of the fourth part of that extent. I have often, from an elevated fituation, where a wider range was fujected to the eye, furveyed with admiration the uncommon face which nature affumes, and made enquiries and attended to conjectures on the causes of these inequalities. Some chuse to attribute them to the successive concussions of earthquakes, through a course of centuries. But they do not seem to be the effect of such a cause. There are no abrupt fiffures; the hollows and swellings are for the most part smooth and regularly sloping, so as to exhibit not unfrequently the appearance of an amphitheatre, and they are cloathed with verdure from the fummit to the edge of the fwamp. From this latter circumftance it is also evident that they are not, as others suppose, occasioned by the fall of heavy rains that deluge the country for one half of the year. The most summary way of accounting for this extraordinary unevenness of surface were to conclude, that in the original construction of our globe, Sumatra was thus formed by the same hand which spread out the fandy plains of Arabia, and raised up the Alps and Andes beyond the region of the clouds. But this is a mode of folution, which, if generally adopted, would become an infuperable bar to all progress in natural knowledge, by damping curiofity and restraining research. Nature, we know from fufficient experience, is not only turned from her original course by the industry of man, but also sometimes checks and croffes her own carreer. What has happened in some instances it is not unfair to suppose may happen in others; nor is it prefumption to trace the intermediate causes of events, which are themselves derived from one first, universal and eternal principle. To me it would feem, that the fprings of water with which these parts of the island abound in an uncommon degree, operate directly, though obscurely, to the producing this irregularity in the furface of the earth. They derive their number, and an extraordinary portion of activity, from the loftiness of the ranges of mountains that occupy the interior country, and intercept and collect the floating vapors. Precipitated into rain at fuch a height,

Causes of this inequality.

the water acquires in its descent through the fiffures or pores of these mountains, a confiderable force, which exerts itself in every direction, lateral and perpendicular, to procure a vent. The existence of these copious fprings is proved, in the facility with which wells are every where funk; requiring no choice of ground, but as it may respect the convenience of the proprietor; all fituations, whether high or low, being prodigal of this valuable element. Where the approaches of the feat have rendered the cliffs abrupt, innumerable rills, or rather a continued moisture is seen to ooze through, and trickle down the steep. Where, on the contrary, the fea has retired and thrown up banks of fand in its retreat, I have remarked the streams of water, at a certain level, and commonly between the boundaries of the tide, effecting their paffage through the loofe and feeble barrier opposed to them. In short, every part of the low country is pregnant with springs that labor for the birth; and these continual struggles, this violent activity of subterraneous waters, gradually undermine the plains above. The earth is imperceptibly excavated, the furface fettles in, and hence the inequalities we speak of. The operation is flow, but unremitting, and, I conceive, fully capable of the effect.

The earth is rich in minerals and other fosfil productions. No country has been more famous in all ages for gold, and though the fources from whence it is drawn may be supposed in some measure exhausted, by the avarice and industry of ages, yet at this day the quantity procured is very confiderable, and doubtless might be much encreased. were the fimple labor of the gatherer affifted by a knowledge of the arts of mineralogy. There are also copper mines, whose ore is very rich, Copper and refembles the Japan copper in the appearance of a mixture of gold. Iron ore is collected, fmelted, formed into metal and worked up in the Iron. country of Menangcabow. That it abounds in many other places is evident, from the color it is perceived to communicate to the foil. On many parts of the coast, the fand of the beach is of a strong shining black, and is attracted by the loadstone. The steel manufactured at the abovementioned place, has a peculiar temper, and a degree of hard-

Earth Oil

Soft Rock.

ness that has never been imitated in Europe. Tin, called by the French writers Calin, is one of the principal export commodities of the island. The country where it chiefly abounds, is in the neighbourhood of Palembang on the east coast, but in many other parts the natives point out its existence, and particularly about Pedattee near Bencoolen. Sulphur is gathered in any quantity about the numerous volcanos. Saltpetre the natives procure, by a process of their own, from the earth which is found impregnated with it; chiefly in extensive caves that have been from the beginning of time, the haunt of a certain species of birds, of whose dung the foil is formed. Coal, mostly washed down by the floods, is collected in feveral parts, particularly at Cattown, Averrammee and Bencoolen. It is light, and not effeemed very good, but I am informed that this is the case with all coal found near the surface of the earth. The veins are observed to run, not in an horizontal, but in an inclined direction, and till the pits have some depth, the fosfil is of an indifferent quality. The little island of Poolo Pisang, close to the foot of Mount Poogong, is chiefly a bed of rock chryftal. Mineral and hot fprings have been discovered in many districts. In taste the waters mostly remble those of Harrowgate, being nauseous to the palate. The oleum terræ, or earth oil, used chiefly as a preservative against the destructive ravages of the white ants, is collected at Ippoe and elsewhere,* There is no species of hard rock to be met with in the low parts of the island, near the sea shore. Besides the ledges of coral, which are covered by the tide, that which generally prevails is the nappal, as it is called by the inhabitants, forming the bafis of the red cliffs, and not unfrequently the beds of the rivers. Though this nappal has the appearance of rock, it possesses in fact so little solidity, that it is difficult to pronounce whether it be a foft stone or only an indurated clay. The furface of it becomes fmooth and gloffy by a flight attrition, and to the touch refembles foap, which is its most striking characteristic. Except those parts of it, which by long exposure to the air, have acquired a greater

degree

^{*} The fountain of Naptha or liquid balfam, found at Pedir, fo much celebrated by the Portuguese writers, is doubtless this oleum terra, or menia tanna, as it is called by the Malays.

degree of hardness, it may easily be cut with a knife or any sharp inftrument; it is not foluble in water, and makes no effervescence with acids. Its component parts appear to be clay and fand bound together by a glutinous or foponacious matter, and its color is either grey, brown or red, according to the nature of the earth, that prevails in its composition. The red nappal has by much the smallest proportion of sand, and feems to possess all the qualities of the steatite or soap earth, found in Cornwall and other countries. The mountain stone is a species of granite, for the most part of a lightish slate colour.

Where the encroachments of the fea have underminded the land, the cliffs are lest abrupt and naked, in some places to a very confiderable Petrefaction. height. In these many curious fossils are discovered, such as petrified wood, and fea shells of various forts. Hypotheses on this subject have been fo ably supported and fo powerfully attacked, that I shall not prefume to intrude myself in the lifts. I shall only observe, that being so near the fea, many would hefitate to allow fuch discoveries to be of any weight in proving a violent alteration to have taken place in the furface of the terraqueous globe; whilft on the other hand it is unaccountable how, in the common course of natural events, such extraneous matter should come to be lodged in strata, at the height perhaps of fifty feet above the level of the water, and as many below the furface of the land. Coloured Here are likewise found various species of earths, which might be applied to valuable purposes, as painters colours and otherwise. The most common are the yellow and red, probably ochres, and the white, which answers the description of the milenum of the ancients.

There are a number of volcano mountains in this, as in almost all the other islands of the eastern archipelago. They are called in the Malay language goonong appee. I have never heard of the lava flowing from them in fuch a quantity, as to cause any damage; but this may be owing to the thinnefs of population, which does not render it necessary for the inhabitants to settle in their neighbourhood. The only volcano I had an opportunity of observing, opened in the fide

Volcanoes.

of a mountain, about twenty miles inland of Bencoolen, one fourth way from its top, as nearly as I can judge. It scarcely ever failed to emit fmoke, but the column was only visible for two or three hours in the morning, feldom rifing and preferving its form, above the upper edge of the hill, which is not of a conical shape, but extending with a gradual flope. The high trees with which the country thereabout is covered, prevent the crater from being discernible at a distance; and this proves, that the spot is not considerably raised or otherwise affected by the eruptions. I could never perceive that it had any connection with the earthquakes, which are very frequently felt there. Sometimes it has emitted fmoke upon these occasions, and in other instances, not. Yet during a fmart earthquake which happened a few years before my arrival, it was remarked to fend forth flame, which it is rarely known to do. The apprehension of the European inhabitants however, is rather more excited, when it continues any length of time without a tendency to an eruption, as they conceive it to be the vent by which the inflammable matter escapes, that would otherwise produce these commotions of the earth. Comparatively with the descriptions I have read of earthquakes in South America and other countries, those which happen in Sumatra, are generally very flight; and the usual manner of building, renders them but little formidable to the natives. The most severe that I have known, was chiefly experienced in the district of Manna, in the year 1770. A village was destroyed by the houses falling down and taking fire, and several lives were loft.* The ground was in one place rent, a quarter of a mile, the width of two fathoms, and four or five deep. A bituminous matter is described to have swelled over the fides of the cavity, and the earth, for a long tong time after the shocks, was observed to contract and dilate alternately. Many parts of the hills far inland, could be diffinguished to have given way, and a consequence of this was, that during three weeks, Manna river was fo much impregnated with

Earthquakes.

particles of clay, that the natives could not bathe in it. At this time

^{*} I am informed that in 1763, an entire village was swallowed up by an earthquake in Poolo Neas, one of the islands which lie off the western coast of Sumatra.

was formed near to the mouth of Padang Goochee, a neighbouring Remarkable river, fouth of the former, a large plain, feven miles long and half effects of an earthquake, a mile broad; where there had been before only a narrow beach. The quantity of earth brought down on this occasion was so considerable, that the hill upon which the English resident's house stands, appears, from indubitable marks, less elevated by fifteen feet than it was before the event. Earthquakes have been remarked by some to happen usually upon sudden changes of weather, and particularly after violent heats; but I do not vouch this upon my own experience, which has been pretty ample. They are preceded by a low rumbling noise like distant thunder. The domestic cattle and fowls are fensible of the preternatural motion, and feem much alarmed; the latter making the cry they are wont to do on the approach of birds of prev. Houses situated in a low sandy soil are least affected, and those which stand on distinct hills, suffer most from the shocks, because the further removed from the center of motion, the greater the agitation; and the loofe contexture of the one foundation, making less resistance than the folidity of the other, subjects the building to less violence. Ships at anchor in the road, though several miles distant from the shore, are strongly sensible of the concussion.

Besides the new land formed by the convulsions above described, the New Land fea by a gradual recess in some parts, produces the same effect. Many formed. instances of this kind; of no considerable extent however; have been observed within the memory of persons now living. But it would seem to me, that that large tract of land called Poolo Point, forming the bay of the name, near to Silebar, with much of the adjacent country, has thus been left by the withdrawing, or thrown up by the motion of the fea. Perhaps the point may have been at first an island; from whence its appellation of Poolo, and the parts more inland, fince gradually united to it. Various circumstances tend to corroborate such an opinion, and to evince the probability that this was not an original portion of the main, but new, half-formed land. All the fwamps and marshy grounds that lie within the beach; and near the extremity there are little else;

are known, in consequence of repeated surveys, to be lower than the level of high water; the bank of fand alone preventing an inundation. The country is not only entirely free from hills or inequalities of any kind, but has fcarcely a vifible flope. Silebar river, which empties itself into Poolo Bay, is totally unlike those in other parts of the island. The motion of its stream is hardly perceptible; it is never affected by floods; its course is marked out, not by banks covered with ancient and venerable woods, but by rows of aquatics, mangroves, &c. fpringing from the water, and perfectly regular. Some miles from the mouth, it opens into a beautiful and extensive lake, diversified with small islands, flat, and verdant with rushes only. The point of Poolo is covered with the Arow tree, or baftard Pine, as fome have called it, * which never grows but in sea fand, and rises fast. None such are found toward Soongeylaymo, and the rest of the shore northward of Marlborough Point, where on the contrary you perceive the effects of continual depredations by the ocean. The old forest trees are there yearly undermined, and falling. obstruct the traveller; whilst about Poolo, the Arow trees are continually springing up, faster than they can be cut down or otherwise destroyed. Nature will not readily be forced from her course. The last time I vifited that part, there was a beautiful rifing grove of Pines, establishing a poffession in their proper soil. The country, as well immediately hereabout, as to a confiderable distance inland, is an entire bed of fand, without any mixture of clay or mould, which I know to have been in vain fought for, many miles up the neighbouring rivers.

Incrochment

But upon what hypothesis can it be accounted for, that the sea should commit depredations on the northern coast; of which there are the most evident tokens, as high up at least as Ippoe, and probably to Indrapour, where the shelter of the neighbouring islands may put a stop to them; and that it should restore the land to the southward, in the manner I have described? I am aware that according to the general motion of

^{*} This Arow tree I have reason to think the same which Captain Cook observed in the South. Seas, and from which he called one low sandy island, the Isle of Pines.

the tides from east to west, this coast ought to receive a continual accesfion, proportioned to the loss which others, exposed to the direction of this motion, must and do sustain; and it is likely that it does gain upon the whole. But the nature of my work obliges me to be more attentive to effects than causes, and to record facts, though they should clash with fystems the most just in theory, and most respectable in point of authority by the description of the thore of the phonomera of whiteheld

baying been hitherto much adverted to be witers, I shall

The chain of islands which lie parallel with the west coast of Sumatra, Islands near may probably have once formed a part of the main, and been seperated probably once from it, either by some violent effort of nature, or the gradual attrition of the fea. I would fearcely introduce the mention of this apparently vague furmife, but that a circumstance presents itself on the coast, which affords fome stronger colour of proof than can be usually obtained in such instances. In many places, and particularly about Pally and Laye, we observe detached pieces of land standing singly, as islands, at the distance, of one or two hundred yards from the shore, which were headlands of points running out into the sea, within the remembrance of the inhabitants. The tops continue covered with trees or shrubs; but the fides are bare, abrupt and perpendicular. The progress of infulation here is obvious and incontrovertable, and why may not larger islands, at a greater distance, have been formed, in the revolution of ages, by the fame accidents? The probability is heightened by the direction of the islands, Neas, Mantawaye, Mego, &c. the fimilarity of soil and productions, and the regularity of foundings between them and the main; whilst without them the depth is unfathomable.

the west coast, joined to it.

Where the shore is flat or shelving, the coast of Sumatra, as of all Coral Rocks other tropical islands, is defended from the attacks of the sea, by a reef or ledge of coral rock, on which the furfs exert their violence without further effect than that of keeping its furface even, and reducing to powder those beautiful excrescences and ramifications which have been so much the object of the naturalist's curiofity, and which some ingenious men, who have analysed them, contend to be the work of insects. The

coral

coral powder is in particular places accumulated on the shore in great quantities, and appears, when not closely inspected, like a fine white fand.

Surf.

The Surf (a word not to be found, I believe, in our dictionaries) is used in India, and by navigators in general, to express a peculiar swell and breaking of the sea upon the shore; the phænomena of which not having been hitherto much adverted to by writers, I shall be the more circumstantial in my description of.

The furf forms fometimes but a fingle range along the shore. At other times there is a succession of two, three, four or more behind each other, extending perhaps half a mile out to sea. The number of ranges is generally in proportion to the height and violence.

The furf begins to affume its form at fome distance from the place where it breaks, gradually accumulating as it moves forward, till it gains a height, in common, of fifteen to twenty feet, when it overhangs at top, and falls like a cascade, nearly perpendicular, involving itself as it descends. The noise made by the fall is prodigious, and during the stillness of the night, may be heard many miles up the country.

Though in the rifing and formation of the furf, the water feems to have a quick progressive motion towards the land, yet a light body on the furface is not carried forward, but on the contrary, if the tide is ebbing, will recede from the shore; from which it would follow, that the motion is only propagated in the water, like sound in air, and not the mass of water protruded. A similar species of motion is observed on shaking at one end, a long cord held moderately slack; which is expressed by the word, undulation. I have sometimes remarked however, that a body which sinks deep, and takes hold of the water, will move towards shore with the course of the surf, as is perceptible in a boat landing, which shoots swiftly forward on the top of the swell; though probably it is aided

aided by its own weight in the descent, after having reached the summit, and to that owes its velocity, with some think, yeight which we call a last. Some think, yeight a last a la

its may be plainly accounted for, from the shallowness and shelv

Countries where the furfs prevail, require boats of a particular construction, and the art of managing them demands the experience of a man's life. All European boats are more or less unfit, and seldom fail to occasion the facrifice of the people on board them, in the imprudent attempts that are fometimes made to land with them on the open coast.

The force of the furf is extremely great. I have known it to overfet a country veffel, in such a manner, that the top of the mast has stuck in the fand, and the lower end made its appearance through her bottom. Pieces of cloth have been taken up from a wreck, twifted and rent by its involved motion.

In some places the surfs are usually greater at high, and in others at low water, but I believe they are uniformly more violent during the spring tides.

I shall proceed to enquire into the efficient cause of the surfs. 'The Considerations respecting the winds have doubtless a strong relation to them. If the air was in all cause of the places of equal denfity, and not liable to any motion, I suppose the water would also remain perfectly at rest, and its surface even; abstracting from the general course of the tides, and the partial irregularities occafioned by the influx of rivers. The current of the air impells the water, and causes a swell, which is the regular rising and subfiding of the waves. This rife and fall is fimilar to the vibrations of a pendulum, and subject to like laws. When a wave is at its height, it descends by the force of gravity, and the momentum acquired in descending, impells the neighbouring particles, which, in their turn, rife and impell others, and thus form a fuccession of waves. This is the case in the open sea; but when the swell approaches the shore, and the depth of water is not in proportion to the fize of the fwell, the fubfiding wave, instead of pressing on a body of a water, which might rise in equal quan-

tity, presses on the ground, whose reaction causes it to rush on in that manner which we call a surf. Some think that the peculiar form of it, may be plainly accounted for, from the shallowness and shelving of the beach. When a swell draws near to such a beach, the lower parts of the water meeting first with obstruction from the bottom, stand still, whilst the higher parts respectively move onward; by which a rolling and involved motion is produced, that is augmented by the return of the preceding swell. I object that this solution is founded on the supposition of an actual progressive motion of the body of water in forming a surf; and that certainly not being the fact, it seems deficient. The only real progression of the water is occasioned by the perpendicular fall, after the breaking of the surf, when, from its weight, it soams on to a greater or less distance, in proportion to the height from which it fell, and the slope of the shore.

That the furfs are not, like common waves, the immediate effect of the wind, is evident from this, that the highest and most violent often happen when there is the least wind, and vice versa. And sometimes the surfs will continue with an equal degree of violence during a variety of weather. On the west coast of Sumatra, the highest are experienced during the S. E. monsoon, which is never attended with such gales of wind as the N. W. The motion of the surf is not observed to follow the course of the wind, but often the contrary; and when it blows hard from the land, the spray of the sea may be seen to sly in a direction opposite to the body of it; though the wind has been for many hours in the same point.

Are the furfs the effect of gales of wind at fea, which do not happen to extend to the shore, but cause a violent agitation throughout a confiderable tract of the waters, which communicating with less distant parts, and meeting at length with resistance from the shore, occasions the sea to swell and break in the manner described? To this I object, that there seems no regular correspondence between their magnitude, and the apparent agitation of the water without them: that gales of wind, except

whilft

except at particular periods, are very unfrequent in the Indian Seas; where the navigation is well known to be remarkably fafe; whilft the furfs are almost continual; and that gales are not found to produce this effect in other extensive oceans. The west coast of Ireland borders a fea, nearly as extensive, and much more wild, than the coast of Sumatra, and yet there; though when it blows hard, the swell on the shore is high and dangerous; is there nothing that refembles the furfs of India.

These, so general in the tropical latitudes, are, upon the most pro- Probable cause bable hypothefis I have been able to form, after long observation, and much thought and enquiry, the confequence of the trade or perpetual winds which pervail, at a distance from shore, between the parallels of ten and thirty degrees north and fouth, whose uniform and invariable action causes a long and constant swell, that exists even in the calmest weather, about the line, towards which its direction tends from either fide. This fwell or libration of the fea, is fo prodigiously long, and the fensible effect of its height of course so much diminished, that it is not often attended to; the gradual flope engroffing almost the whole horizon, to an eye not very much elevated above its furface: but persons who have failed in those parts may recollect that even when the sea is apparently the most still and level, a boat or other object at a distance from. the ship, will be hid from the fight of one looking towards it from the lower deck, for the space of minutes together. This swell, when a fquall happens, or the wind freshens up, will, for the time, have other fubfidiary waves on the extent of its furface, breaking often in a direction contrary to it, and which will again fubfide as a calm returns, without having produced on it any perceptible effect. Sumatra, though not directly exposed to the fouth east trade, is not so distant but that its. influence may be prefumed to extend to it, and accordingly at Poolo Pifang near the fouthern extremity of the island, a constant foutherly fea is observed, even after a hard northwest wind. This incessant and powerful fwell rolling in from an ocean, open even to the pole, feems an agent adequate to the prodigious effects produced on the coast;

whilst its very fize contributes to its being overlooked. It reconciles almost all the difficulties which the phænomena seem to present, and in particular it accounts for the decrease of the furf during the N. W. monfoon, the local wind then counteracting the operation of the general one; and it is corroborated by an observation I have made, that the furfs on the Sumatran coast ever begin to break at their southern extreme, the motion of the swell not being perpendicular to the direction of the shore. This manner of explaining their origin feems to carry much reason with it, but there occurs to me one objection which I cannot get over, and which a regard to truth obliges me to state. The trade winds are remarkably fleady and uniform, and the fwell generated by them is the fame. The furfs are much the reverse, feldom persevering for two days in the same degree of violence; often mountains high in the morning, and nearly subfided by night. How comes an uniform cause to produce effects fo unfteady; unless by the intervention of secondary causes whose nature and operation we are unacquainted with?

It is clear to me that the furfs, as above described, are peculiar to those climates which lie within the remoter limits of the trade winds, though in higher latitudes, large fwells and irregular breakings of the fea are to be met with, after boifterous weather. Poffibly the following causes may be judged to conspire, with that I have already specified, towards occasioning this distinction. The former region being exposed to the immediate influence of the two great luminaries, the water, from their direct impulse, is liable to more violent agitation, than nearer the poles, where their power is felt only by indirect communication. The equatorial parts of the earth performing their diurnal revolution with greater velocity than the rest, a larger circle being described in the same time, the waters thereabout, from the stronger centrifugal force, may be supposed more buoyant; to feel less restraint from the fluggish principle of matter; to have less gravity; and therefore to be more obedient to external impulses of every kind, whether from the winds or any other cause.

The spring tides on the west coast of Sumatra are estimated to rise in general no more than sour feet, as little perhaps as in any part of the globe; owing to its open, unconfined situation, which prevents any accumulation of the tide, as is the case in narrow seas. It is always high water when the moon is in the horizon, and consequently at six o'clock, nearly, on the days of conjunction and opposition throughout the year; in parts not far remote from the equator*. This according to Newton's Theory, is about three hours later than the uninterrupted course of nature; owing to the obvious impediment the waters meet with in revolving from the eastward.

* Owing to this uniformity it becomes an eafy matter for the natives to ascertain the height of the tide at any hour that the moon is visible. Whilst she appears to ascend, the water falls, and vice versa; the lowest of the ebb happening when she is in her meridian. The rule for calculating the tides is rendered also to Europeans, more simple and practical, from the same cause. There only needs to add together, the epact, number of the month, and day of the month, the sum of which, if under thirty, gives the moon's age—the excess, if over. Allow forty eight minutes for each day, or which is the same, take four fifths of the age, and it will give you the number of hours after fix o'clock, at which high water happens. A readiness at this calculation is particularly useful in a country where the sea beach is the general road for travelling.

Distinction of Inhabitants.—Rejangs chosen for General Description.

—Persons and Complexion.—Clothing and ornaments.

General Account of the Inhabitants. HAVING exhibited a general view of the island, as it is in the hands of nature, I shall now proceed to a description of the people who inhabit and cultivate it, and shall endeavour to distinguish the several species or classes of them, in such a manner as may best tend to perspicuity, and to surnish clear ideas of the matter.

Various modes of division.

The most obvious division, and which has been usually made by the writers of voyages, is that of Mahometan inhabitants of the fea coaft, and Pagans of the inland country. This division, though not without its degree of propriety, is vague and imperfect; not only because each description of people differ confiderably among themselves, but that the inland inhabitants are, in some places, Mahometans, and those of the coast, in others, what they term Pagans. It is not unusual with persons who have not refided in this part of the east, to call the inhabitants of the islands indiscriminately by the name of Malays. This is a more confiderable error, and productive of greater confusion than the former. attempting to reduce things to heads too general, we defeat the very end we propose to ourselves in defining them at all: we create obscurity where we wish to throw light. On the other hand, to attempt enumerating and diftinguishing the variety, almost endless, of petty fovereignties and nations, into which this island is divided, many of which differnothing in person or manners from their neighbours, would be a task both impossible and useless. I shall aim at steering a middle course, and accordingly shall treat of the inhabitants of Sumatra under the following fummary diffinctions; taking occasion as it may offer, to mention the principal subdivisions. And first, it is proper to distinguish the empire

of Menangcabow and the Malays; in the next place the Achenese; then the Battas; the Rejangs; and next to them, the Lampoons.*

Menangcabow being the principal fovereignty of the island, which for- Menangcabow merly comprehended the whole, and still receives a shadow of homage from the most powerful of the other kingdoms, which have sprung up from its ruins, would feem to claim a right to precedence in description, but I have a sufficient reason for deferring it to a subsequent part of my work; which is, that the people of this empire, by their conversion to

* Attempts to ascertain from whence the island of Sumatra was originally peopled, must rest upon mere conjecture. The adjacent peninfula prefents the most obvious source of population, and it is accordingly faid that Malayan emigrants supplied the Archipelago with inhabitants : but no argument, except that of vicinity, can be produced in support of this, not unplausible, opinion . The Malays, now fo called, are in comparison of the internal Sumatrans, but as people of yesterday; and though they have spread their language and manners far and wide, since the foundation of Malacca in the thirteenth century, they are confidered as intruders only, among the aboriginal people of the eastern islands. I have elsewhere remarked, that one general language prevailed, (however mutilated and changed in the course of time), throughout all this portion of the world; from Madagafcar, to the most distant discoveries eastward; of which the Malay is a dialect, much corrupted, or refined, by a mixture of other tongues. This very extensive similarity of language indicates a common origin of the inhabitants, but the circumflances and progrefs of their feparation, are wrapped in the darkest veil of obscurity.

In the course of my enquiries amongst the natives, concerning the aborigines of the island, I have been informed of two different species of people dispersed in the woods, and avoiding all communication with the other inhabitants. These they call Orang Goodoo, and Orang Googoo. The former are faid to be pretty numerous, especially in that part of the country which lies between Palembang and Jambee. Some have at times been caught and kept as flaves in Laboon, and a man of that place is now married to a tolerably handsome Cochoo girl, who was carried off by a party that discovered their huts. They have a language quite peculiar to themselves, and they cat promiseuously whatever the woods afford, as deer, elephant, rhinoceros, wild hog, snakes or monkeys. The Googoo are much scarcer than these, differing in little but the use of speech, from the Orang Outan of Borneo; their bodies being covered with long hair. There have not been above two or three inflances of their being met with by the people of Laboon, (from whom my information is derived), and one of these was entrapped many years ago, in much the same manner as the carpenter in Pilpay's Fables caught the monkey. He had children by a Laboon woman, which also were more hairy than the common race; but the third generation are not tobe diffinguished from others. The reader will bestow what measure of faith he thinks due, on this relation, the veracity of which I do not pretend to vouch for. It has probably fome foundation in truth, but is exaggerated in the circumstances.

Mahometanism.

Malays.

Mahometanism, and consequent change of manners, have lost in a great degree the genuine Sumatran character, which is the immediate object of my investigation. They are distinguished by the appellation of Malays, by the rest of the island, which, though originally, and strictly denoting an inhabitant of the neighbouring peninfula, is now underflood to mean a Muffulman, speaking the Malay language, and belonging, by descent, at least, to the kingdom of Menangcabow, or to that part of the sea coast bordering on it, called Atay Angin, which extends from thirty two minutes N. to forty minutes S. latitude. Hereabout a colony from the peninfula evidently fettled, from whence their descendents emigrating, took up their refidence at different fea ports on the fouthern coast, as far down as Bencoolen; introduced their language, and scatered every where the feeds of their religion, which as they fhot up, either withered, or flourished more or less according to the aptness of the foil, and the pains of the laborer. Beyond Bencoolen there are none to be met with, excepting fuch as have been drawn thither by, and are in the pay of the Europeans. On the eastern fide of the island they are fettled at the entrance of almost all the navigable rivers, where they more conveniently indulge their natural bent for trade and piracy. It must be observed that the term Malay, in common speech, like that of Moor on the west of India, is almost synonymous with Mahometan. When the Sumatrans, or natives of any of the eastern islands, learn to read the Arabic character, and fubmit to circumcifion, they are faid to become Malays (munjaddee Malayo.) But this is not a proper or accurate mode of speaking. The sultan of Anac Soongey, it is true, ambitious of imitating the fultan of Menangcabow, stiles himself and subjects. Malays: yet his neighbour the Pangeran of Soongey Lamo, chief of the Rejangs, who is equally an independent prince, and very enlightened Mahometan. will not allow himself to be other than an original Sumatran*. Thus much it was necessary I should say, in order to avoid abiguity, concern-

^{*} He feemed offended at my supposing him a Maylayman, in a conversation I once had with him on the subject, and replied with some emotion, "Malayo tedab, Sir; orang color betool fayo. "No Malay Sir; I am a genuine, original countryman." The two languages, he writes and talks with equal facility, but the Rejanghe efteems his mother tongue.

ing the Malays, of whom a more particular account will be given hereafter. The meet od on who son they have our rollyly

As the most diffimilar among the other classes into which I have divided the inhabitants, must of course have very many points of mutual refemblance, and many of their habits, customs and ceremonies, in common, it becomes expedient, in order to avoid a troublesome and useless repetition, to fingle out one class from among them, whose manners shall undergo a particular and complete investigation, and serve as a standard for the whole; the deviation from which, in the other classes, shall afterwards be pointed out, and the most fingular and striking usages peculiar to each, fupperadded. Various circumstances induce me, on this occasion, to give the preference to the Rejangs, though a nation of Rejangs adopbut fmall account in the political fcale of the island. They are placed in what may be called a central fituation, not geographically, but with tion. respect to the encroachments of foreign manners and opinions, introduced by the Malays, from the north, and Javans from the fouth; which gives them a claim to originality, fuperior to that of most others. They are a people whose form of government and whose laws extend, with very little variation, over a confiderable part of the island, and principally that portion where the connexions of the English lie. There are traditions of their having formerly fent forth colonies to the fouthward; and in the country of Paffummah, the fite of their villages is still pointed out; which would prove that they have formerly been of more confideration than they can boast at present. They have a proper language, and a perfect written character, that is become of general use in many remote districts. These advantages point out the Rajang people as an eligible flandard of description; and a motive equally strong that induces me to adopt them as fuch, is, that my fituation and connexions on the island, led me to a more intimate and minute acquaintance with their laws and manners, than with those of any other class. I must premise however that the Malay customs having made their way, in a greater or less degree, to every part of Sumatra, it will be totally impossible to discriminate with entire accuracy, those which are original,

L

ted as a fland-ard of descrip-

from

from those which are borrowed; and of course, what I shall say of the Rejangs, will apply for the most part, not only to the Sumatrans in general, but may sometimes be, in strictness, proper to the Malays alone, and by them taught to the higher rank of country people.

Situation of the Rejang country. The country of the Rejangs is divided, to the north west, from the kingdom of Anac Soongey (of which Moco Moco is the capital) by the small river of Oori, near that of Cattown; which last, with the district of Laboon on its banks, bounds it on the north or inland side. The country of Moosee, where Palembang river takes its rise, forms its limit to the eastward. Bencoolen river, precisely speaking, consines it on the south east; though the inhabitants of the district called Lemba, extending from thence to Silebar, are entirely the same people, in manners and language. The principal rivers, besides those already mentioned, are Laye, Polley, and Soongeylamo; on all of which the English have factories, the resident or chief being stationed at Laye.

Persons of the

The persons of the inhabitants of the island, though differing confiderably in districts remote from each other, may in general be comprehended in the following description; excepting the Achenese, whose commixture with the Moors of the west of India, has distinguished them from the other Sumatrans.

General defcription. They are rather below the middle stature; their bulk is in proportion; their limbs are for the most part slight, but well shaped, and particularly small at the wrists and ankles. Upon the whole they are gracefully formed, and I scarcely recollect to have ever seen one deformed person, of the natives.* The women, however, have the preposterous custom of slattening the noses, and compressing the heads of children newly

* Ghirardini, an Italian painter, who touched at Sumatra on his way to China in 1698, obferves of the Malays,

Son di persona tanto ben formata

Quanto mai singer san pittori industri.

He speaks in high terms of the country, as being beautifully picturesque.

born,

born, whilft the skull is yet cartilagenous, which increases their natural tendency to that shape. I could never trace the origin of the practice, or learn any other reason for moulding the features to this uncouth appearance, but that it was an improvement of beauty in their estimation. Captain Cook takes notice of a fimilar operation at the island of Ulitea. They likewise pull out the ears of infants, to make them stand erest from the head. Their eyes are uniformly dark and clear, and among fome, especially the fourthern women, bear a strong resemblance to the Chinese, in that peculiarity of formation so generally observed of those people. Their hair is strong, and of a shining black; the improvement of both which qualities, it probably owes, in great measure, to the constant and early use of coconut oil, with which they keep it moist. The men frequently cut their hair short, not appearing to take any pride in it; the women encourage theirs to a confiderable length, and I have known many inftances of its reaching the ground. The men are beardless, and have chins so remarkably smooth, that were it not for the Malay priefts displaying a little tuft, we should be apt to conclude that nature had refused them this token of manhood. It is the same in respect to other parts of the body, with both fexes; and this particular artention to their persons, they esteem a point of delicacy, and the contrary an unpardonable neglect. The boys, as they approach to the age of puberty, rub their chins, upper lips, and those parts of the body that are fubject to fuperfluous hair, with chunam, (quick lime,) especially of fhells, which destroys the roots of the incipient beard. The few pilæ that afterwards appear, are plucked out from time to time with tweezers, which they always carry about them for that purpose. Were it not for the numerous and very respectable authorities, from which we are affured that the natives of America are naturally beardless, I should think that the common opinion on that subject had been rashly adopted, and that their appearing thus at a mature age, was only the consequence of an early practice, fimilar to that observed among the Sumatrans. now I must confess that it would remove some small degree of doubt

from my mind, could it be afcertained that no fuch custom prevails.* Their complexion is properly yellow, wanting the red tinge that conflitutes a tawny or copper color. They are in general lighter than the Mestees, or half breed, of the rest of India; those of the superior class, who are not exposed to the rays of the sun, and particularly their women of rank, approaching to a great degree of fairness. Did beauty consist in this one quality, some of them would surpass our brunettes in Europe. The major part of the semales are ugly, and many of them even to disgust, yet there are those among them, whose appearance is strikingly beautiful; whatever composition of person, features and complexion, that sentiment may be the result of.

Color not afcribable to climate.

The fairness of the Sumatrans, comparatively with other Indians. fituated as they are, under a perpendicular fun, where no feafon of the year affords an alternative of cold, is, I think, an irrefragable proof, that the difference of color in the various inhabitants of the earth, is not the immediate effect of climate. The children of Europeans born in this island, are as fair, and perhaps in general fairer, than those born in the country of their parents. I have observed the same of the second generation, where a mixture with the people of the country has been avoided. On the other hand, the offspring and all the descendants of the Guinea and other African flaves, imported there, continue in the last instance as perfectly black as in the original stock. I do not mean to enter into the merits of the question which naturally connects with these observations; but shall only remark, that the sallow and adust countenances, fo commonly acquired by Europeans who have long refided in hot climates, are more ascribable to the effect of bilious distempers, which almost all are subject to in a greater or less degree, than of their exposure to the influence of the weather, which few but feafaring people are

liable

^{*} It is allowed by travellers that the Patagonians have tufts of hair on the upper lip and chin. Captain Carver fays, that among the tribes he vilited, the people made a regular practice of eradicating their beards with pincers. At Bruffels is preferved, along with a variety of ancient and curious fuits of armour, that of Montezuma King of Mexico, of which the vizor, or mark for the face, has remarkably large whifkers; an ornament which those Americans could not have simitated, unless nature had presented them with the model.

liable to, and of which the impression is seldom permanent. From this circumstance I have been led to conjecture that the general disparity of complexions in different nations, might possibly be owing to the more or less copious secretion, or redundance of that juice, rendering the skin more or less dark according to the qualities of the bile prevailing in the constitutions of each. But I fear such an hypothesis would not stand the test of experiment, as it must follow, that upon dissection, the contents of a negroe's gall bladder, or at least the extravasated bile, should uniformly be found black. Persons skilled in anatomy will determine whether it is possible that the qualities of any animal secretion can so far affect the frame, as to render their consequences liable to be transmitted to posterity in their full force.

The fmall fize of the inhabitants, and especially of the women, may be in some measure owing to the early communication between the sexes; though, as the inclinations which lead to this intercourse are prompted here, by nature, sooner than in cold climates, it is not unfair to suppose that being proportioned to the period of maturity, this is also sooner attained to, and consequently that the earlier cessation of growth of these people, is agreeable to the laws of their constitution, and not occasioned by a premature and irregular appetite.

The men of fuperior rank encourage the growth of their hand nails, particularly those of the fore and little fingers, to an extraordinary length; frequently tinging them red, with the expressed juice of a shrub called eeni; as they do the nails of their feet also, to which, being always uncovered, they pay as much attention as to their hands. The hands of the natives, and even of the half breed, are always cold to the touch; which I cannot account for otherwise than by a supposition, that from the less degree of elasticity in the solids, occasioned by the heat of the climate, the internal action of the body, by which the sluids are put in motion, is less vigorous, the circulation is proportionably languid, and of course the diminished effect is most perceptible in the extremities, and a coldness there is the natural consequence.

Hill people fubject towens

The natives of the hills through the whole extent of the island, are fubject to those monstrous wens from the throat, which have been obferved of the Vallais, and the inhabitants of other mountainous districts in Europe. It has been usual to attribute this affection, to the badness, thawed state, mineral quality, or other peculiarity of the waters; many skilful men having applied themselves to the investigation of the subject. My experience enables me to pronounce without hefitation, that the diforder, for fuch it is, though it appears here to mark a distinct race of people (orong goonong), is immediately connected with the hilliness of the country, and of course, if the circumstances of the water they use contribute, it must be only so far as the nature of that water is affected by the inequality or height of the land. But on Sumatra neither fnow nor other congelation is ever produced, which militates against the most plausible conjecture that has been adopted concerning the Alpine goiters. From every refearch that I have been enabled to make, I think I have reason to conclude, that the complaint is owing, among the Sumatrans, to the fogginess of the air in the valleys between the high mountains, where, and not on the fummits, the natives of these parts reside. I before remarked, that between the ranges of hills, the cabout or dense mist, was visible for feveral hours every morning; rifing in a thick, opake and well defined body, with the fun, and feldom quite dispersed till after noon. This phoenomenon, as well as that of the wens, being peculiar to the regions of the hills, affords a prefumption that they may be connected; exclusive of the natural probability, that a cold vapour, gross to an uncommon degree, and continually enveloping the habitations, should affect with tumors the throats of the inhabitants. I cannot pretend to fay how far this folution may apply to the cafe of the goiters, but I rerecollect it to have been mentioned, that the only method of curing these people, is by removing them from the valleys, to the clear and pure air on the tops of the hills; which feems to indicate a fimilar fource of the distemper with what I have pointed out. The Sumatrans do not appear to attempt any remedy for it, the wens being confistent with the highest health in other respects.

The personal difference between the Malays of the coast, and the Difference in country inhabitants, is not fo firongly marked but that it requires fome Malays and experience to distinguish them. The latter, however, possess an evident other Sumatrans. fuperiority in point of fize and strength, and are fairer complexioned, which they probably owe to their fituation, where the atmosphere is colder; and it is generally observed, that people living near the sea shore, and especially when accustomed to navigation, are darker than their inland neighbours. Some attribute the disparity in constitutional vigor, to the more frequent use of opium among the Malays, which is fupposed to debilitate the frame; but I have noted that the Leemoon and Batang Affy gold traders, who are a colony of that race fettled in the heart of the island, and who cannot exist a day without opium, are remarkably hale and flout; which I have known to be observed with a degree of envy by the opium fmokers of our fettlements. The inhabitants of Paffummah alfo, are described as being more robust in their persons, than the planters of the low country.

The original clothing of the Sumatrans is the fame with that found by Clothing. navigators among the inhabitants of the South Sea islands, and now generally called by the name of Otaheitean cloth. It is still used among the Rejangs for their working drefs, and I have one in my poffession, procured from those people, confisting of a jacket, short drawers, and a cap for the head. This is the inner bark of a certain species of tree, beat out to the degree of fineness required; approaching the more to perfection, as it resembles the softer kind of leather, some being nearly equal to the most delicate kid-skin; in which character it somewhat differs from the South Sea cloth, as that bears a refemblance rather to paper, or to the manufacture of the loom. The country people now conform in a great meafure to the dress of the Malays, which I shall therefore describe in this place; observing that much more simplicity still prevails among the former; who look upon the others as coxcombs, that lay out all their fubstance on their backs, whilst, in their turns, they are regarded by the Malays with contempt, as unpolifhed ruftics.

A man's

Man's drefs.

A man's drefs confifts of the following. A close waitcoat, without fleeves, but having a neck like a shirt, buttoned close up to the top, with buttons, often, of gold fillagree. This is peculiar to the Malays. Over this they wear the badjoo, which refembles a morning gown, open at the neck, but fastened close at the wrists and half way up the arm, with nine buttons to each fleeve. The badjoo worn by young men, is open in front no farther down than the bosom, and reaches no lower than the waift, whereas the others hang loofe to the knees, and fometimes to the ancles. They are made usually of blue or white cotton cloth; for the better fort, of chintz, and for great men, of flowered filks. The cayen farrong is not unlike a Scots highlander's plaid, in appearance, being a piece of party colored cloth about fix or eight feet long, and three or four wide, fowed together at the ends; forming, as fome writers have described it, a wide fack without a bottom. This is fometimes gathered up, and flung over the shoulder like a fash, or else folded and tucked about the waift and hips; and in full drefs, it is bound on by the creefe (dagger) belt, which is of crimfon filk, and wraps feveral times round the body, with a loop at the end, in which the sheath of the creefe hangs. They wear short drawers, reaching half way down the thigh, generally of red or yellow taffeta. There is no covering to their legs or feet. Round their heads they fasten, in a particular manner, a fine, colored handkerchief, fo as to refemble a small turban; the country people usually twisting a piece of white or blue cloth for this purpose. The crown of their head remains uncovered, except on journeys, when they wear a toodong or umbrella-hat, which compleatly Kreens them from the weather.

Woman's

The women have a kind of bodice, or short waistcoat rather, that defends the breafts, and reaches to the hips. The cayen farrong, before described, comes up as high as the armpits, and extends to the feet. being kept on fimply by folding and tucking it over, at the breaft, except when the tallee pending, or zone, is worn about the waift, which forms an additional and neceffary fecurity. This is usually of embroidered cloth, and fometimes a plate of gold or filver, about two inches broad,

fastening

fastening in front with a large clasp of fillagree or chased work, with fome kind of precious stone, or imitation of such, in the center. The badjoo, or upper gown, differs little from that of the men, buttoning in the same manner at the wrists. A piece of fine, thin, blue cotton cloth, about five feet long, and worked or fringed at each end, called a salendang, is thrown across the back of the neck, and hangs down before; ferving also the purpose of a veil to the women of rank when they walk abroad. The handkerchief is carried, either folded small in the hand, or at length, over the shoulder. There are two modes of dressing the hair, one termed coondye, and the other fangoll. The first resembles much the fashion in which we fee the Chinese women represented in paintings, and which I conclude they borrowed from thence, where the hair is wound circularly over the center of the head, and fastened with a filver bodkin or pin. In the other mode, which is more general, they give the hair a fingle turn as it hangs behind, and then doubling it up, they pass it crosswife, under a few hairs separated from the rest, on the back of the head, for that purpose. A comb, often of tortoiseshell, and sometimes fillagreed, helps to prevent it from falling down. The hair of the front, and of all parts of the head, are of the fame length, and when loofe, hang together behind, with most of the women, in very great quantity. It is kept moist with oil, commonly of the cocoa-nut, but those who can afford it make use of an empyreumatic oil, extracted from gum Benjamin, as a grateful perfume. They wear no covering, except ornaments of flowers, which, on particular occasions, are the work of much labor and ingenuity. The head dreffes of the dancing girls by profession, who are usually Javans, are very artificially wrought, and as high as any modern English lady's cap, yielding only to the feathered plumes of the year 1777. It is impossible to describe in words these intricate and fanciful matters, so as to convey a just idea of them. The flowers worn in undrefs are, for the most part, strung in wreaths, and have a very neat and pretty effect, without any degree of gaudiness, being usually white or pale yellow, fmall, and frequently only half blown. Those generally chosen for these occasions, are the boongo-tanjong and boongo-mellear: the boongo-choompaco is used to give the hair a fragrance, but is concealed

concealed from the fight. They fometimes combine a variety of flowers in fuch a manner as to appear like one, and fix them on a fingle flock; but these, being more formal, are less elegant, than the wreaths.

Distinguishing ornaments of virgins.

Among the country people, particularly in the fouthern countries, the virgins (orang gaddees, or goddeffes, as it is usually pronounced) are diffinguished by a fillet which goes across the front of the hair, and fastens behind. This is commonly a thin plate of filver, about half an inch broad: those of the first rank have it of gold, and those of the lowest class have their fillet of the leaf of the neepab tree. Besides this peculiar ornament, their state of pucellage is denoted by their having rings or bracelets of filver or gold on their wrifts. Strings of coins round the neck are univerfally worn by children, and the females, before they are of an age to be clothed, have, what may not be inaptly termed, a modefly piece, being a plate of filver in the shape of a heart, hung before by a chain of the same metal, passing round the waist. The young women in the country villages, manufacture themselves the cloth that constitutes the principal and often the only part of their dress, or the caven farrong, and this reaches from the breast no lower than the knees. Those worn by the Malay women and men, come from the Bugguess islands to the eastward, and with them extend as low as the feet: but here, as in other inflances, the more scrupulous attention to appearances, does not accompany the superior degree of real modesty.

Mode of filing

Both fexes have the extraordinary custom of filing and otherwise disfiguring their teeth, which are naturally very white and beautiful, from the simplicity of their food. For a file, they make use of a small whetstone, and the patients lie on their back during the operation. Many, particularly the women of the Lampoon country, have their teeth rubbed down quite even with the gums; others have them formed in points, and some file off no more than the outer coat and extremities, in order that they may the better receive and retain the jetty blackness, which they almost universally adorn them with. The black used on these occasions is the empyreumatic oil of the cocoa-nut shell. When this is not applied, the

filing does not, by destroying what we term the enamel, diminish the whiteness of the teeth. The great men sometimes set theirs in gold, by casing, with a plate of that metal, the under row; and this ornament, contrasted with the black dye, has, by lamp or candle light, a very splendid effect. It is sometimes indented to the shape of the teeth, but more usually quite plain. They do not remove it either to eat or sleep.

At the age of about eight or nine, they bore the ears of the female children; which is a ceremony that must necessarily precede their marriage. This they call betenday, as they call filing their teeth bedabong; both which operations are regarded in the family, as the occasions of a festival. They do not here, as in some of the adjacent islands, (of Neas in particular), encourage the aperture of the ear to a monstrous size, so as in many instances to be large enough to admit the hand through, the lower parts being stretched till they touch the shoulders. Their earings are mostly of gold fillagree, fastening, not with a class, but in the manner of studs.

of initiation, and furgedfied by the improvements of other nations, which have made greater advances towards civilization. These allered less striking and characteristic features, in delibeating the picture of manable matches of they may add to the beauty, diminish from the genularants of the place. We madent leok for unequivees generic marks, where the breed, in order to enced it, has been crofted by a foreign mixture. All the ares of the conversity are comprehended within two diffinctions. Those which protect as from the inetermine of the weather and order quivard accidents; and those which are employed in fecuring the means of fibrillent. Both are namediately electrical to the continuance of life, and man is involuntarily and immediately prompted to exercise them, by the urgent calls of nature, even in the merell continuance of live and man is involuntarily and immediately prompted to exercise them, by the urgent calls of nature, even in the merell continues of favore and incultivated exidence. Hos mountains with his every reliant sold layer and the state of the s

Shall now attempt a description of the villages and buildings of the Sumatrans, and proceed to their domestic habits of economy, and those fimple arts, on which the procuring of their food and other necessaries depend. These are not among the least interesting objects of philosophical speculation. In proportion as the arts in use with any people are connected with the primary demands of nature, they carry the greater likehood of originality, because those demands must have been administered to, from a period coeval with the existence of the people themfelves. Or if complete originality be regarded as a visionary idea, engendered from ignorance, and the obscurity of remote events, such arts must be allowed to have the fairest claim to antiquity at least. Arts of accommodation, and more especially of luxury, are commonly the effect of imitation, and fuggested by the improvements of other nations, which have made greater advances towards civilization. These afford less striking and characteristic features, in delineating the picture of mankind, and though they may add to the beauty, diminish from the genuineness of the piece. We must not look for unequivocal generic marks. where the breed, in order to mend it, has been croffed by a foreign mixture. All the arts of primary necessity are comprehended within two distinctions. Those which protect us from the inclemency of the weather and other outward accidents; and those which are employed in fecuring the means of subfishence. Both are immediately effential to the continuance of life, and man is involuntarily and immediately prompted to exercise them, by the urgent calls of nature, even in the merest possible state of savage and uncultivated existence. In climates like that of Sumatra, this impulse extends not far. The human machine is kept going with small effort, in so favourable a medium. The spring of importunate necessity there foon loses its force, and consequently the wheels of invention that depend upon it, fail to perform more than a few

few fimple revolutions. In regions less mild this original motive to industry and ingenuity, carries men to greater lengths, in the application of arts to the occasions of life; and which of course, in an equal space of time, attain to greater perfection, than among the inhabitants of the tropical latitudes, who find their immediate wants supplied with facility, and beyond what these require, prefer simple inaction, to convenience procured by labor. This consideration may perhaps tend to reconcile the high antiquity universally allowed to Asiatic nations, with the limited progress of arts and sciences among them; in which they are manifestly surpassed by people who, compared with them, are but of very recent date.

The Sumatrans, however, in the confruction of their habitations, have stept many degrees beyond those rude contrivances, which writers describe the inhabitants of some other Indian countries, to have been contented with adopting, in order to screen themselves from the immediate influence of surrounding elements. Their houses are not only substantial, but convenient, and are built in the vicinity of each other, that they may enjoy the advantages of mutual assistance and protection, resulting from a state of society.

the warmth of the climate renders the free admillion of air, a matter

The doofoons or villages; for the small number of inhabitants affembled in each does not entitle them to the appellations of towns; are always situated on the banks of a river or lake, for the convenience of bathing, and of transporting goods. An eminence difficult of ascent, is usually made choice of, for security. The access to them is by footways, narrow and winding, of which there are seldom more than two; one to the country, and the other to the water; the latter in most places so steep, as to render it necessary to cut steps in the cliff or rock. The doofoons being surrounded with abundance of fruit trees; some of considerable height, as the doorean, coco and betel-nui; and the neighbouring country, for a little space about, being in some degree cleared of wood, for the rice and pepper plantations; they strike the eye at a diffance as clumps merely, exhibiting no appearance of a town or any place

timbers

of habitation. The rows of houses form commonly a quadrangle, with passages or lanes at intervals between the buildings, where, in the more considerable villages, live the lower class of inhabitants, and where also their paddee-houses or granaries are erected. In the middle of the square stands the balli, or town hall, a room about sifty to an hundred feet long, and twenty or thirty wide, without division, and open at the sides, excepting when on particular occasions it is hung with mats or chintz.

the limited proprefs of arts and felences among them; in which they are

Buildings.

In their buildings neither stone, brick, nor clay, are ever made use of, which is the case in most countries where timber abounds, and where the warmth of the climate renders the free admission of air, a matter rather to be defired, than guarded against: but in Sumatra the frequency of earthquakes is alone fufficient to have prevented the natives from adopting a substantial mode of building. The frames of the houses are of wood, the underplate resting on pillars of about fix or eight feet in height, which have a fort of capital, but no base, and are wider at top than at bottom. The people appear to have no idea of architecture as a science, though much ingenuity is often shewn in the manner of working up their materials, and they have, the Malays at least, technical terms corresponding to all those employed by our house carpenters. Their conception of proportions is extremely rude, often leaving those parts of a frame which have the greatest bearing, with the weakest support, and lavishing strength upon inadequate pressure. For the floorings they lay whole bamboos (a well known species of large cane) of four or five inches diameter, close to each other, and fasten them at the ends to the timbers. Across these are laid laths of split bamboo, about an inch wide and the length of the room, which are tied down with filaments of the rattan; and over these are usually spread mats of different kinds. This fort of flooring has an elasticity, alarming to strangers when they first tread on it. The sides of the houses are generally closed in with paloopo, which is the bamboo half split, opened, and rendered flat by notching the circular joints withinfide, and laying it to dry in the fun, pressed down with weights. This is sometimes nailed on to the upright timbers

timbers or bamboos, but in the country parts, it is more commonly interwoven, or matted, in breadths of fix inches, and a piece, or fheet, formed at once of the fize required. In some places they use for the fame purpose the cooliteayos, or coolicov, as it is pronounced by the Europeans, who employ it on board ship, as dunnage, in pepper and other cargoes. This is a bark procured from some particular trees, of which the boonoot and ceboo are the most common. When they prepare to take it, the outer rind is first torn or cut away; the inner, which affords the material, is then marked out with a prang, patcel, or other tool, to the fize required, which is uniformly three cubits by one; it is afterwards beaten for fome time with a heavy flick, to loofe it from the stem, and being peeled off, is laid in the fun to dry, care being taken to prevent it's warping. The thicker or thinner forts of the fame species of coolitcayos, owe their difference to their being taken nearer to, or farther from, the root. That which is used in building has nearly the texture and hardness of wood. The pliable and delicate bark of which clothing is made, is procured from a tree called calawee, a bastard species of the bread-fruit.

The most general mode of covering houses is with the attap, which is the leaf of a species of palm called neepab. These, previous to their being laid on, are formed into sheets of about five feet long, and as deep as the length of the leaf will admit: they are then disposed on the roof, so as that one sheet shall lap over the other, and are tied to the bamboos which serve for rasters. There are various other kinds of covering used. The coolitcayos, before described, is sometimes employed for this purpose: the galoompye—this is a thatch of narrow, split bamboos, six feet in length, placed in regular layers, each reaching within two feet of the extremity of that beneath it, by which a treble covering is formed: ejoo—this is a vegetable production, so nearly resembling horse hair as scarcely to be distinguished from it. It envelopes the stem of that species of palm called anou, from which the best toddy or palm wine is procured, and is employed by the natives for a great variety of purposes. It is bound on as a thatch, in the manner we do straw, and

not unfrequently over the galcompye; in which case the roof is so durable as never to require renewal, the ejoo being of all vegetable substances the least prone to decay, and for this reason it is a common practice to wrap a quantity of it round the end of timbers or posts which are to be fixed in the ground. I saw a house about twenty miles up Manna river, belonging to Dupatty Bandar Augoong, the roof of which was of fifty years standing. The larger houses have three pitches in the roof; the middle one, under which the door is placed, being much lower than the other two. In smaller houses there are but two pitches which are always of unequal height, and the entrance is in the smaller, which covers a kind of hall, or cooking room.

There is another kind of house, erected mostly for a temporary purpose, the roof of which is flat, and is covered in a very uncommon, simple, and ingenious manner. Large, streight bamboos are cut of a length sufficient to lie across the house, and being split exactly in two, and the joints knocked out, they are disposed in an order alternately concave and convex, in such manner that each of the latter salls into two of the former which lie next it, something like the laying of pantils. The convex bamboos perfectly defend the building from rain, and the concave serve as gutters to carry the water off*.

The mode of ascent to the houses is by a piece of timber, or flout bamboo cut in notches, which latter an European cannot avail himself of, especially as the precaution is seldom taken of binding them sast. These are the wonderful light scaling ladders, which the old Portuguese writers described to have been used by the natives of Acheen in their wars with their nation. It is probable that the apprehension of danger from the wild beasts, caused them to adopt and continue this rude expedient, in preference to more regular and commodious steps. The detached buildings in the country, near to their plantations, called tal-

^{*} I find that the original inhabitants of the Philippine islands covered their buildings in the same

longs, they raise to the height of ten or twelve feet from the ground, and make a practice of taking up their ladder at night, to fecure themselves from the destructive ravages of the tigers. I have been assured; but will not pledge myself for the truth of the story; that an elephant, attempting to pass under one of these houses; which stand on four or fix posts; Auck by the way, but disdaining to retreat, carried it, with the family it contained, on his back, to the distance of several miles.

In the buildings of the doofoons, particularly where the most respectable families refide, the wood work in front is carved, in the style of bass relief, into a variety of uncouth ornaments, and grotesque figures, not much unlike the Egyptian hieroglyphics, but certainly without any myftic or hiftorical allufion. I man at the most ed aboltonical and other

lady in Lamboon? where they giv

The furniture of their houses, corresponding with their manner of Furnitures. living, is very fimple, and confifts of but few articles. Their bed is a mat, ufually of a fine texture, and manufactured for the purpose, with a number of pillows, worked at the ends, and adorned with a shining substance that remsembles foil. A fort of canopy or valance, formed of various coloured cloths, hangs over head. As they fit on the floor, there is no occasion for stools or chairs. Instead of tables, they have what refembles large wooden falvers, with feet, called doolang; round each of which, three or four persons dispose themselves; and on this are laid the tallams or brass waiters, which hold the cups that contain their curry, and plantain leaves, or matted veffels, filled with rice. Their mode of fitting is not crofs legged, as the inhabitants of Turkey, and our taylors, use, but either on the haunches, or on the left fide, fupported by the left hand, with the legs tucked in on the right fide; leaving that hand at liberty, which they always, from motives of delicacy, forupulously eat with; the left being reserved for less cleanly offices. Neither knives, spoons, nor any substitutes for them, are employed; they take up the rice, and other victuals, between their thumb and fingers, and dexteroufly throw it into the mouth by the action of the thumb; dipping frequently their hands in water, as they eat.

Utenfils.

They have a little coarse china, imported by the Buggues praws, which is held as matter of luxury. In cooking they employ a kind of iron vessel, well known in India by the name of quallee or tauch, resembling in shape the pans used in some of our manufactures, having the rim wide, and bottom narrow. These are likewise brought from the eastward. The preeo and belange, species of earthen pipkins, are in more common use, being made in small quantities in different parts of the island, particularly in Lampoon, where they give them a fort of glazing; but the greater number of them are imported from Bantam. The original Sumatran vessel for boiling rice, and which is still much used for that purpose, is the bamboo; that material of general utility, with which bountiful nature has supplied an indolent people. By the time the rice is dressed, the utensil is nearly destroyed by the fire; but resists the slame so long as there is moisture within.

Fires.

Fire being wanted among these people but occasionally, and only when they cook their victuals, there is not much attention paid, in their buildings, to providing conveniencies for it. Their houses have no chimneys, and their fire places are no more than a few loofe bricks, or stones, disposed in a temporary manner, and frequently on the landing place before the doors. The fuel made use of is wood alone; the coal which the island produces, never being converted by the inhabitants to that purpose. The flint and steel for striking fire, are common in the country, but it is a practice certainly borrowed from some other people, as that species of stone is not, I believe, a native of the soil. These generally form part of their travelling apparatus, and especially with those men called reefews (spendthrifts that turn freebooters), who find themselves often obliged to take up their habitation in the woods, or in deferted houfes. But they also frequently kindle fire, from the friction of two sticks. They chuse a piece of dry, porous wood, and cutting smooth a spot of it, lay it in an horizontal direction. They then apply a finaller piece, of a harder substance, with a blunt point, in a perpendicular position, and turn it quickly round, between the two hands, as chocolate is milled, preffing it downwards at the same time. A hole is soon formed by this motion

Mode of kind.

of the smaller stick; but it has not penetrated far, before the larger one takes fire. I have also seen the same effect produced, more simply, by rubbing one bit of bamboo, with a sharp edge, across another*.

Water is conveyed from the spring, in bamboos, which, for this purpose, are cut, either to the length of five or fix feet, and carried over the shoulder, or into a number of single joints, that are put together in a basket. It is drunk out of the fruit called labor here, and calabash, in the West Indies, a hole being made in the side of the neck, and another at top for vent. In drinking, they generally hold the vessel at a distance above their mouths, and catch the stream as it descends. Baskets (bronong, baccole) are a considerable part of the surniture of a man's house, and the number of these seen hanging up, are tokens of the owner's substance: for in them his harvests, of rice or pepper, are

* This mode of kindling fire is not peculiar to Sumatra : we read of the fame practice in Africa, and even in Kamschatka. It is surprizing, but confirmed by abundant authority, that many nations of the earth, have, at certain periods, being ignorant of the use of fire. To our immediate apprehension, human existence would feem in such circumstances impossible. Every art, every convenience, every necessary of life, is now in the most intimate manner connected with it : and yet the Chinefe, the Egyptians, Phoenicians and Greeks acknowledged traditions concerning its first discovery in their respective countries. But in fact, if we can once suppose a man, or society of men, unacquainted with the being and uses of this element, I see no difficulty in conceiving the possibility of their supporting life without it; I mean in the tropical climates; and of centuries paffing before they should arrive at the important discovery. It is true that lightening and its effects, volcanos, the firing of dry fubstances by fortutious attrition, or of moist, by fermentation, might give them an idea of its violent and destructive properties; but far from being thence induced to appropriate and apply it, they would, on the contrary, dread and avoid it, even in its lefs formidable appearances. They might be led to worship it as their deity, but not to cherish it as their domestic. There is every reason to conclude that the man who first reduced it to subjection, and rendered it subservient to the purposes of life, procured it from the collision of two flints; but the sparks thus produced, whether by accident or defign, might be observed innumerable times, without its suggesting a beneficial application. In countries where those did not present themselves, the discovery had, most probably, its origin in the rubbing together of dry sticks, and in this operation, the agent and subject co-existing, slame, with its properties and uses, became more immediately apparent. Still, as no previous idea was conceived of this latent principle, and confequently no fearch made, no endeavours exerted, to bring it to light, I fee not the impossibility a priori, of its having remained almost as long concealed from mankind, as the properties of the loadstone, or the qualities of gunpowder.

gathered and brought home; no carts being employed in the interior parts of the island, which I am now describing. They are made of slices of bamboo, connected by means of split rattans; and are carried, chiefly by the women, on the back, supported by a string, or band, across the forehead.

Food.

Although the Sumatrans live, in a great measure, upon vegetable food, they are not reftrained, by any fuperstitious opinion, from other aliments, and accordingly, at their entertainments, the flesh of the buffaloe (carbow), goat, and fowls, are ferved up. Their dishes are almost all prepared in that mode of dreffing, to which we have given the name of curry, and which is now univerfally known in Europe. It is called in the Malay language, goolye, and may be composed of any kind of edible, but is generally of flesh or fowl, with a variety of pulse and succulent herbage, flewed down with certain ingredients, by us termed, when mixed and ground together, curry powder. These ingredients are, among others, the cayenne or chili pepper, turmeric, ferraye or lemon grafs, cardamums, garlick, and the pulp of the coco-nut bruifed to a milk refembling that of almonds, which is the only liquid made use of. This differs from the curries of Madras and Bengal, which have greater variety of spices, and want the coco-nut. It is not a little remarkable, that the common pepper, the chief produce and staple commodity of the country, is never mixed by the natives in their food. They esteem it heating to the blood, and afcribe a contrary effect to the cayenne; which, I can fay, my own experience justifies. A great diversity of curries is usually served up at the same time, in small vessels, each flavored, to a nice discerning taste, in a different manner; and in this confifts all the luxury of their tables. Let the quantity or variety of meat be what it may, the principle article of their food is rice, which is eaten in a large proportion with every dish, and very frequently without any other accompaniment than falt and chili pepper. It is prepared by boiling in a manner peculiar to India; it's perfection, next to cleanness and whiteness, confisting in it's being, when thoroughly dreffed and foft to the heart, at the same time whole and separate, so that no two bendung grains.

grains shall adhere together. The manner of effecting this, is by putting into the earthen or other vessel in which it is boiled, no more water than is sufficient to cover it; letting it simmer over a slow sire; taking off the water by degrees with a flat ladle or spoon, that the grain may dry, and removing it when just short of burning. At their entertainments, the guests are treated with rice prepared also in a variety of modes, by frying it in cakes, or boiling it, mixed with the kernel of the coco-nut and fresh oil, in small joints of bamboo. This is called lemmang. Before it is served up, they cut off the outer rind of the bamboo, and the soft inner coat is peeled away by the person who eats.

They dress their meat immediately after killing it, while it is still warm, which is conformable with the practice of the ancients, as recorded in Homer and elsewhere, and in this state it is said to eat tenderer than when kept for a day: longer, the climate will not admit of, unless when it is preserved in that mode called dinding: This is the flesh of the buffaloe cut into small thin stakes, and exposed to the heat of the fun in fair weather; generally on the thatch of their houses; till it is become so dry and hard as to refist putrefaction, without any affistance from falt. Fish is preserved in the same manner, and cargoes of both are fent from parts of the coast where they are plenty, to those where provisions are in more demand. It is seemingly strange, that heat, which, in a certain degree, promotes putrefaction, should, when violently encreased, operate to prevent it; but it must be considered that moisture also is requisite to the former effect, and this is absorbed in thin fubstances, by the sun's rays, before it can contribute to the production of maggots.

Blachang, a preservation, if it may be so termed, of an opposite kind, is esteemed a great delicacy among the Malays, and is by them exported to the west of India. The country Sumatrans seldom procure it. It is a species of cavear, and is extremely offensive and disgusting to persons who are not accustomed to it; particularly the black kind, which is the most common. The best fort, or the red blachang, is made of the

Q

spawn of shrimps, or of the shrimps themselves, which they take about the mouths of rivers. They are left in the sun to dry, then pounded in a mortar, with salt, moistened with a little water, and formed into cakes; which is all the process. The black fort, used by the lower class, is made of small sish, prepared in the same manner. On some parts of the east coast of the island, they salt the roes of large sish, and preserve them perfectly dry, and well slavored.

When the natives kill a buffaloe, which is always done at their public meetings, they do not cut it up into joints, as we do an ox, but into small pieces of flesh, or stakes, which they call bantye. The hide of the buffaloe is scalded, scraped, and hung up to dry in their houses, where it shrivels, and becomes perfectly hard. When wanted for use, a piece is chopped off, and being stewed down for a great number of hours, in a small quantity of water, forms a rich jelly, which, properly seasoned, is esteemed a very delicate dish.

The fagoo, though common on Sumatra, and used occasionally by the natives, is not an article of food of such general use among them, as with the inhabitants of many other eastern islands, where it is employed as a substitute for rice. The tree which yields it, is a species of palm, whose trunk contains a glutinous pith, that being soaked, dried, and granulated, becomes the sago of our shops, has been too frequently and accurately described, to need a repetition from me. Millet (randa jaou) is also cultivated for food, but not in any considerable quantity.

When these several articles of subsistance fail, the Sumatran has recourse to those wild roots, herbs, and leaves of trees, which the woods abundantly afford in every season, without culture, and which the habitual simplicity of his diet, teaches him to consider as no very extraordinary circumstance of hardship. Hence it is, that famines, in this island; or more properly speaking, failures of crops of grain; are never attended with those dreadful consequences, which more improved countries, and more provident nations experience.

Agriculture.

Agriculture.—Rice, its Cultivation, &c.—Plantations of Coco, Betel nut, and other Trees, for Domestic use.—Dye stuffs.

FROM their domestic economy I am led to take a view of their la-Agriculture, bours in the field, their plantations and the state of argiculture amongst them, which an ingenious writer esteems the justest criterion of civilization.

The most important article of cultivation, not on Sumatra alone, but Rice. It is the grand material of food, on which at least fifty millions of the inhabitants of the earth subsist, and although chiefly confined by nature to the regions included between, and bordering on the tropics, its cultivation is probably more extensive than that of wheat, which the Europeans are wont to consider as the universal staff of life. In the continent of Asia, as you advance to the northward, you come to the boundary where the plantations of rice disappear, and the wheat fields commence; the cold felt in that climate, owing in part to the extreme height of the land, being unfriendly to the production of the former article.

Rice (bras) whilst in the huse, is in India called paddee, and assumes a different name in each of its other various states. We observe no distinction of this kind in Europe, where our grain retains through all its stages, till it becomes flour, its original name of barley, wheat or oats*. Among people whose general objects of contemplation are few,

^{*} The following, befide many others, are names applied to rice, in its different flages of growth and perparation: paddee; original name of the feed: ooffay; grain of last feason: bannee; the plants before removed to the sawoors: bras or bray; rice, the husk of the paddee being taken off: charroop; rice cleaned for boiling: nasses, boiled rice: peerang; yellow rice: jambar; a fervice of rice, &c.

those which do of necessity engage their attention, are often more nicely discriminated, than the same objects among more enlightend people, whose ideas ranging over the extensive field of art and science, disdain to fix long on obvious and common matters. Paddee, on Sumatra and the Malay islands, is distinguished into two forts, Laddang or up-land paddee, and Sawoor or low-land, which are always kept feperate, and will not grow reciprocally*. Of these the former bears the higher price, being a whiter, heartier and better flavored grain, and having the advantage in point of keeping. The latter is much more prolific from the feed, and subject to less risk in the culture, but is of a watery substance, produces less increase in boiling, and is subject to a swifter decay. It is however in more common use than the former. Befide this general distinction, the paddee of each fort, particularly the Laddang, prefents a variety of species, which, as far as my information extends, I shall enumerate. and endeavour to describe. The common kind of dry ground paddee: color, light brown: the fize rather large, and very little crooked at the extremity. Paddee undallong: dry ground: short round grain: grows in whorles or bunches round the stock. Paddee ebbass: dry ground: large grain: common. Paddee galloo: dry ground: light colored: fcarce. Paddee fennee: dry ground: deep colored: fmall grain: scarce. Paddee ejoo: dry ground: light colored. Paddee kooning: dry ground: deep yellow: fine rice: crooked, and pointed. Paddee coccor ballum: dry ground: much efteemed: light colored; fmall, and very much crooked, refembling a dove's nail, from whence its name. Paddee pefang: dry ground: outer coat light brown; inner red: longer, smaller and less crooked than the coocoor ballum. Paddee Santong: the finest fort that is planted in wet ground: small, streight, and light colored. In general it may be observed that the larger grained rice is the least esteemed, and the smaller and whiter, the most prized. In the Lampoon country they make a distinction of paddee crawang, and paddee jerroo, the fromer of which is a month earlier in growth than the latter.

^{*} Le Poivre, in the Travels of a Philosopher, observes the same distinction in the rice of Cochin China.

I shall speak first of the cultivation of the Laddang or upland paddee. Upland paddee This is fown, as is obvious from the name, in high grounds, and almost universally on the fite of old woods, on account of the superior richness of the foil; the continual fall and rotting of the leaves, forming there a bed of vegetable mould, which the open plains cannot afford, being exhausted, by the powerful operation of the sun's rays, and the conftant production of a rank grass, called lallang. When this lallang, with which the eaftern islands, are for the most part covered, where the ground is free from wood, is kept under by frequent mowing, or the grazing of cattle, it's room is supplied with grass of a finer texture. Many suppose that the same, identical species of grass undergoes this alteration, as no fresh seeds are sown, and the change uniformly takes place. But this is an evident mistake, as the generic characters of the two are effentially different, the one being the gramen caricofum, and the other the gramen aciculatum, described by Rumphius. The former, which grows to the height of five feet, is remarkable for the whiteness. and foftness of the down, which is it's bloffom, and the other for the tharpness of it's bearded feeds, which prove extremely troublesome to the legs of those who walk among it *.

On account of the fertility which it occasions, the natives do not look upon the abundance of wood in the country, as an inconvenience,

^{* &}quot; Gramen caricofum. Hoc totos occupat campos, nudosque colles; tam densé & laté germinans, ut, è longinquo. haberetur campus oryzà confitus : tam luxuriosé & fortiter crescit, ut neque hortos neque fylvas evitet, atque tam vehementer prorepit, ut areæ vix depurari ac fervari poffint, licet quotidie deambulentur."

[&]quot; Gramen aciculatum. Usus ejus fere nullus est, sed hic detigendum est tædiosum ludibrium, quod quis habet, si per campos, vel in sylvis procedat, ubi boc gramen ad vias publicas crescit, quum præterientium vestibus semen quam maxime inhæret." Rumphius. Le Poivre, in his-Travels of a Philosopher, describes the plains of Madagascar and Java, as covered with a long grass, which he calls Fatak, and which, from the analogy of the countries in other respects, I should suppose to be the lallang: but he praises it as affording excellent pasturage; whereas on Sumatra it is reckoned the worst, and except when very young, it is not edible by the largest cattle; for which reason the carters and drovers constantly set fire to that which grows on the plains by the road fide, that the young shoots which afterwards spring up, may supply food to their beafts.

but the contrary. In few parts of the island do they ever sow grain on land that has been long cleared, and there, more from necessity than choice. I have heard a prince of the country complain of a settlement made by some strangers in the inland part of his dominions, whom he should be under an obligation to expell from thence, to prevent the waste of his old woods. This seemed a superstuous act of precaution in an island which strikes the eye as one general, impervious, and inexhaustible forest *.

On the approach of the dry monfoon, or about the month of April, the husbandman makes choice of a spot, for his laddang of that season, and collecting his family and dependants, proceeds to fell the timber in order to clear the ground. This is a labor of immense magnitude, and would feem to require herculean force; but it is effected by perfeverance. Their tools, the prang and billiong, (the former refembling a bill-hook, and the latter an imperfect adze), are feemingly inadequate to the task, and the saw is unknown in the country. Being regardless of the timber, they do not fell the tree near the ground, where the stem is thick, but erect a stage, and begin to hew, or chop rather, at the height of ten or twelve feet, where the dimensions are smaller, till it is fufficiently weakened to admit of their pulling it down with rattans, in place of ropes, made fast to the branches . And thus by flow degrees the whole is laid low. I could never behold this devastation without a strong sentiment of regret. Perhaps the prejudices of a classfical education taught me to respect those aged trees, as the habitation or material frame of an order of fylvan deities, who were now deprived of existence, by the facrilegious hand of a rude, undistinguishing savage. But without having recourse to superstition, it is not difficult to account for fuch feelings, on the fight of a venerable wood, old as the

^{*} The quickness of vegetation precludes all possibility of clearing a country so thinly inhabited. Ground, where paddee has been planted, will, in a single month after the harvest, afford full shelter for a tiger.

⁺ The Maison rustique de Cayenne, describes a similar mode of felling trees.

foil it flood on, and beautiful beyond what pencil can describe, annihilated, for the temporary use of the space it occupied. It appears a violation of nature, in the exercise of a too arbitrary right. The timber thus felled is of no value, from it's abundance, the smallness of confumption, and it's distance, in common, from the banks of rivers, by the means of which alone it can be transported to any distance. Trees, whose amazing bulk, height, and streightness would excite the admiration of a traveller, compared to which the masts of men of war are diminutive, fall in the general ruin. The branches are lopped off, and when the continuance of the dry weather has rendered them sufficiently arid, they are set fire to, and the country is, for the space of a month, in a general blaze, till the whole is consumed. The expiring wood, beneficent to it's ungrateful destroyer, fertilizes for his use, by it's ashes and their salts, the earth from which it sprung, and which it so long adorned.

eds, as they be

Unseasonable wet weather at this period, which sometimes happens, is productive of much inconvenience, by lofs of prefent time, and throwing the crop back. There are impostors that make a profit of the credulity of the husbandmen; who, like all others whose employments expose them to risks, are prone to superstition; by pretending to a power of caufing, or retarding rain. One of these will receive, at the time of burning the laddangs, a dollar or more from each family in the neighbourhood, that he may procure favorable weather for their bufiness. To accomplish this purpose, he abstains, or pretends to abstain, for many days and nights, from food and fleep, and performs various trifling ceremonies, continuing all the time in the open air. If he efpies a cloud gathering, he immediately begins to fmoak tobacco with great vehemence, walking about quick, and throwing the puffs towards it with all the force of his lungs. How far he is fuccessful, it is no difficult matter to judge. His skill, in fact, lies in chusing his time, when there is the greatest prospect of a continuance of fair weather in the ordinary course of nature : but should he fail, there is an effectual falvo. He always promifes to fulfill his agreement, with a Deo volente clause,

and so attributes his occasional disappointments to the particular interposition of the deity. The conning-men, who, in this and many other instances of conjuration, impose on the simple country people, are always Malay adventurers.

When the periodical rains begin to fall, which happens gradually about September or October, they proceed to fow the grain. Ploughs are rarely used, and only in the open plains, when cultivated, in countries where the old woods are comparatively scarce. In the grounds I am describing, the stumps of the trees would utterly preclude the possibility of working them. The husbandman enters the plantation; as it is usual to call the paddee field; with a sharp stake in each hand, and with these makes holes on either side of him, at equal distances, as he proceeds. Another person follows him with the seed, of which he drops a few grains into each hole; leaving it to accident, or the winds and rain, to cover it. The birds, as may be expected, often prove distructive foes, and in a plantation far removed from any other, they have been known to devour the whole. The above is all the labour that a laddang requires, till the harvest time, which is estimated at five months and ten days from the period of sowing.

Low ground rice.

The preparation of the Sawoor, or low ground plantations, is as follows. After clearing away the brush wood, and aquatic shrubs, with which the swamps and marshes, when neglected, are overun, a number of buffaloes, whose greatest enjoyment consists in wading and rolling in mud, are turned in. These work it up by their motions, and enrich it with their dung. The next care is to level it well, that the water, when introduced, may lie equally on all the parts. For this purpose, in some districts of the country, they contrive to drag about on the surface, a slat board with earth on it, to depress the rising spots, and sill up the hollow ones. The whole is then divided by parallel dams, by means of which the water is retained, or let off at pleafure. These divisions or plats, are called peering, which signifies a dish.

thin Ways promifes to fulfill his agreement, with a Des volente claufe.

Whilst this work is going on, a spot is prepared in a convenient part of the ground, where the feed paddee is fown, in small patches, very thick, for transplanting, and in this state it is called bunnay. When it is about two or three inches high, the tops are cropped in order to multiply the shoots. At the end of forty days from first sowing, the transplantation takes place: holes are made in the fawoor as described in the laddang, and a few plants put in each; a referve being made in the patches to supply the place of such as shall have failed upon removal. The innumerable springs and runs of water with which this island abounds, render unnecessary the laborious processes by which water is raifed and supplied to the plantations in the West of India, where the country is level, and the foil fandy: yet still the principal art of the planter confifts, and is required, in the management of this article; to furnish it to the ground in proper and moderate quantities, and to carry it off, from time to time, by drains; for it must on no account be long flagnant, as a neglect of that kind would occasion the grain to rot. When the paddee begins to form the ear, or to bloffom, as the natives express it, the water is all finally drawn off. They now begin to prepare their machines for frightening away the birds, in which they employ incredible pains, and wonderful ingenuity. The strings and clappers are fo disposed, that a child shall be able, with the simple motion of it's arm, to create a loud, clattering noise, through every part of an extenfive plantation; and on the borders are placed, at distances, a species of windmill fixed on poles, which, to an unexperienced traveller, have as tremendous an effect as those which terrified the Knight of la Mancha,

In four months from the time of transplanting, they begin to reap the grain. The mode of doing this is the same with both species of paddee. The ears are cut off pretty short, one by one, with a rude instrument, resembling the stump of a knise, in a bamboo hast *. This is performed with one hand, as if the ears were plucked, and each, as taken off, is put into the other hand, till that is full; when they are

Reaping.

extent

^{*} The inhabitants of Menangcabow reap with an inftrument refembling a fickle.

tied up in a little sheaf, and thrown into a basket, which they carry for the purpose, either by their side, or slung on their back, with the string or strap across the forehead. The quantity of paddee which they can grasp in both hands, whilst thus in the ear, is said to be equal to a bamboo (gallon) when threshed out, and is often sold by that estimation.

Threshing.

Different nations have adopted various methods of feparating the grain from the ear. The most ancient we read of, was that of driving cattle over the sheaves, in order to trample it out. Large planks; blocks of marble; heavy carriages; have been employed in later times for this end. In most parts of Europe the slail is now in use. The Sumatrans have a mode different from all these. The paddee in the ear being spread on mats in their barns, they rub it out with their feet; supporting themselves, for the more easy performance of their labor, by holding with their hands a bamboo placed across, over their heads. Although by going always unshod, their feet are extremely callous, and therefore in some degree adapted to this work, yet the workmen, when closely tasked by their masters, sometimes continue shuffling 'till the blood issues from their soles. This is the universal practice throughout the island.

A laddang, in any of the districts that lie near the sea coast, cannot be used two sollowing seasons, though a sawoor may; yet in the inland country, where the temperature of the air is more savorable to agriculture, they have been known to sow the same ground, three successive years. It is common there also to plant a crop of onions, so soon as the stubble is burned off. Millet is sown at the same time with the paddee.

are to diffeefed, that a child thall be able, with the first

In the country of Manna, a progress in the art of cultivation is discovered, superior to what appears in almost any other part of the island; among the Battas perhaps alone excepted. Here the traveller may observe pieces of land, in size from five to sisteen acres, regularly ploughed and harrowed. I shall endeavour to account for this difference. Manna is much the most populous district to the southward, with the smallest

extent

extent of fea coast. The pepper plantations and laddangs together, have in great measure exhausted the old woods, in the accessible parts of the country, and the inhabitants are therein deprived of a fource of fertility which nature formerly supplied. They must either starve, remove their plantations, or cultivate the earth. The first is contrary to the inherent principle which teaches man to preserve life by every possible means: Their attachment to their natale folum, or rather their veneration for the fepulchres of their ancestors, is fo strong, that to remove, would cost them a flruggle equal almost to the pangs of death: Necessity therefore, the parent of art, obliges them to cultivate the earth. The produce of Rate of Prothe grounds thus tilled, is reckoned at thirty for one: from the laddangs in common, it is about fixty to eighty. The fawoors are generally supposed to yield an increase of an hundred for one, and in some of the northern parts (at Soofee) an hundred and twenty. These returns are very extraordinary, compared with the produce of our fields in Europe, which, I believe, feldom exceeds fifteen, and is often under ten. What is this disproportion owing to? Perhaps to the difference of grain, as rice may be in it's nature extremely prolific: perhaps to the more genial influence of a warmer climate: perhaps the earth, by an excessive cultivation, loses by degrees her fecundity. An attention to the observations and reports of travellers, would feem to give countenance to this supposition. Peru, which may be called new land, is said to yield four or five hundred for one. Babylon, anciently, two to three hundred. Lybia an hundred and fifty. Egypt an hundred. Yet of the two latter, modern naturalists inform us, the one produces, at this day, but ten to twelve, and the other from four to ten, for one. The Peruvian account I fuspect of exaggeration, or that it is the result of some particular and partial experiment, as it is well known what a furprizing crop may be procured from a fmall quantity of grain, fown feparately, and carefully weeded. The other accounts are probably just, but the falling off in these countries, as well as the difference between the European and eastern produce, I attribute, more than to any other cause, to the different style of cultivation. With us the saving of labor and promoting of expedition, are the chief objects, and in order to effect thefe

these, the grain is almost universally scattered in the furrows, except where the drill has been introduced. The Sumatrans, who do not calculate their own or their domestic's labor on these occasions, make holes in the ground, as I have described, and drop into each a few grains; or by a process still more tedious, raise the seed in beds, and afterwards plant it out. Mr. Charles Miller, in a paper published in the Phil. Trans. has shewn us the wonderful effects of transplantation. How far it might be worth the English farmer's while, to bestow more labor in the bufiness of sowing his grain, in hopes of an increase of produce, I am not competent, nor is it to my present purpose, to form a judgment. Possibly, as the advantage might be found to lie rather in the quantity of grain faved in the fowing, than gained in the reaping, it would not answer the purpose; for although half the quantity of seed, bears reciprocally the fame proportion to the usual produce, that double the latter does to the usual allowance of feed, yet in point of profit it is quite another matter. In order to encrease this, it is of much more importance to augment the produce from a given quantity of land, than to diminish the grain necessary to fow it.

Fertility of foil

Notwithstanding the received opinion of the fertility of the Malay islands, countenanced by the authority of Le Poivre and other celebrated writers, and still more by the extraordinary produce of grain, as abovementioned, I cannot help faying, that I think the foil of Sumatra is in general rather steril, than rich. It is almost every where a stiff, red clay, burned nearly to the state of a brick, where it is exposed to the influence of the fun. The finall proportion of the whole which is cultivated, is either ground from which old woods have been recently cleared, whose leaves had formed a bed of vegetable earth, some inches deep; or elfe fwamps, into which the feanty mould of the neighbouring hills, has been washed by the annual torrents of rain, in consequence of their low fituation. It is true that on many parts of the coalt, there are, between the cliffs and the beach, small plains of a sandy soil, probably left by the fea, and more or lefs mixed with earth in proportion to the time they have remained uncovered by the waters; and fuch are found to prove the most favorable spots for raising the productions

of the western world. But these are partial and unsatisfactory proofs of fertility. The great increase from the feed, is, as I have suggested, more probably owing to the mode of fowing, than to superior richness of the land, and would not appear if the European method of feattering it were followed. Although in Manna they have got into the practice of tilling the ground, and derive from thence a produce of thirty for one, in open plains, it must be observed, that this is still new land, though not just then cleared for the purpose, and the same spot is doubtless not worked a second time till it has lain fallow. Every person. who has attempted to make, on Sumatra, a garden of any kind, must well know how ineffectual a labour it would prove, to attempt turning up with the fpade a piece of ground adopted at random. It becomes necessary for this purpose, to form an artificial foil, of dung, ashes, rubbish, and fuch other materials as can be procured. From fuch alone he can expect to raise the smallest supply of vegetables for the table. I have seen many extensive plantations of coco-nut, penang, and coffee-trees, laid out at a confiderable expence, by different gentlemen, and not one do I recollect to have succeeded; owing to the barrenness of the country. These disappointments have induced the Europeans almost entirely to neglect agriculture. The more industrious Chinese colonists who work the ground with indefatigable pains, and dung high, are rather more fuccessful; yet have I heard one of the most able cultivators among this people *, who, by the dint of labor and perfeverance, had raifed a delightful garden near Fort Marlborough, defigned for profit as well as pleafure, declare, that his heart was almost broke in struggling against nature; the foil being fo ungrateful, that instead of obtaining a return for his trouble and expence, the undertaking was likely to render him a bankrupt; and which he would inevitably have been but for affiftance afforded him by the India Company. The natives, it is true, without much or any cultivation, raise some useful trees and plants, but they are in very fmall quantities, and immediately about their villages, where

^{*} Key Soon: his taste in gardening was exquisite, and his affiduity unremitting. Some particular plants, especially the *tea*, he used to tell me he considered as his children: his first care in the morning, and last at night was to tend and cherish them.

the earth is fertilized in spite of their indolence, by the common sweepings of their houses and streets, and the mere vicinity of their buildings. I have often had occasion to observe, in young plantations, that those few trees which furrounded the house of the owner, or the hut of the keeper, confiderably over-topped their brethren of the same age. Every person at first fight, and on a superficial view of the Malay countries, pronounces them the favorites of nature, where she has lavished all her bounties with a profusion unknown in other regions, and laments the infatuation of the people, who neglect to cultivate the finest foil in the world. But I have scarcely known one, who, after a few years residence, has not entirely altered his opinion. Certain it is, that in point of external appearance, the Malay islands, and Sumatra among the rest, may challenge the world to a comparison. There indeed nature has been extravagant, bestowing on many parts of the country, where human foot scarce ever trod, all that is adapted to raise the sentiment of sublimity, in minds fusceptible of the impression. But how rarely are those minds to be found; and yet it is alone

"For such the rivers dash their foaming tides,
The mountain swells, the vale subsides,
The stately wood detains the wand'ring sight,
And the rough, barren rock grows pregnant with delight."

Even where there are inhabitants, to how little purpose has she been thus prosuse in ornament! In passing through some places, where my fancy has been charmed with more beautiful and truly picturesque scenes, than I remember ever to have met with before, I could not avoid regretting that a country so captivating to the eye, should be allotted to a race of people who seem totally insensible of it's beauties.

After treading out the grain, which is equivalent to threshing, the next step is to winnow it, which is done precisely in the same manner as practised by us. Advantage being taken of a windy day, it is poured out from the sieve or fan; the chass dispersing, whilst the heavier grain falls to the ground. This mode seems to have been universal in all

ages and countries. The next process is that of clearing the grain from Mode of clearthe husk, by which, from paddee, it becomes rice. This is done in the grain. the Leffcong, or large wooden mortar, where it is pounded, by one or more persons, with heavy pestles, of wood also, called Alloo, till the outer coat is separated; after which it is again fanned. This business is likewife, in some places, performed with a machine; which is no more than a hollow cylinder of heavy wood, turned back and forwards, horizontally, by two handles, on a folid cylinder of the fame diameter, and at the fame time preffed down, to encrease the friction. The grain is put into the hollow cylinder, which answers the purpose of a hopper, at the fame time that it performs the business of the upper millstone in our mills. A spindle runs up from the center of the lower piece of wood, which ferves as an axis for the upper to turn on.

The rice is now in a state for fale, exportation, or laying up. It will Rice as an arnot keep above twelve months, particularly the fawoor rice, which begins to shew figns of decay after fix. At Natal they have a practice of putting a quantity of the leaves of a shrub called Lagoondee, amongst their rice, in granaries or boats holds, which having a strong antiseptic virtue, destroys the weevils that usually breed in it. In Bengal, I am told they kiln-dry the rice intended for exportation, owing to which, or some other process, it will continue good for several years, and is on that account made use of for garrisons in the Malay countries. In the flate of paddee it will keep long without damaging, which induces the country people to lay it up in the sheaf; clearing it of the husk; or beating it out, as it is termed; from time to time, as wanted for use. By this operation it loses one half of it's quantity in measurement, two bamboos of paddee yielding but one of rice. To render it perfectly clean for eating, a circumstance they are particularly attentive to, it is put a fecond time into a leffoong of smaller fize, and being sufficiently pounded, without breaking the grains, it is again winnowed, by toffing it in a flat fieve, till the pure and spotless grain is dexterously seperated from the bran. They next wash it in cold water, and then proceed to boil it, in the manner before described. It will be the book to be the beautiful and the beautiful

The price of this necessary of life, differs throughout the island, according to the general demand at the place where it is purchased, and the circumstances of the season. At a northern port called Soosoo, it is seldom under thirty bamboos (gallons) the Spanish dollar. In the southern districts, where the cultivation is more confined, and the soil less productive, it varies from twelve to four bamboos, according as the harvest is more or less plentiful, or the market better or worse supplied with imported rice.

the functione prefied down, to encrease the friction. The grain is put

Coconut.

The Coco-nut tree may be esteemed the next important object of cultivation, from the uses to which it's produce is applied by the natives of India; though on Sumatra it is not converted to fuch a variety of purposes, as in those islands where nature has been less bountiful in other gifts. It's value here confifts principally in the kernel of the nut, of which the confumption is prodigious, being a principal ingredient in all their dishes. The stem is in but little estimation for building, where the finest timber so much abounds. The hulk is not twisted into ropes, called coyar, as on the other fide of India, rattans and ejoo being used for that purpose. The shell is but little employed as a domestic utenfil, the lower class of the people preferring the bamboo and the laboo, and the better fort being possessed of coarse earthen ware. The filaments which furround the stem are probably manufactured into cloth in those countries alone, where cotton is not produced, which is a material infinitely preferable: befides, that certain kinds of trees, as before observed, afford, in their soft and pliable bank, a species of cloth ready woven to their hands. Of the coconut, however, they make oil for the hair, and for burning in lamps; though, in the interior country, the light most commonly used, is from the dammar or turpentine, of which links are formed. Toddy, a liquor effeemed for various purposes, and partigularly in the manufacture of arrack, is drawn from this, as well as other species of the palm; from the head they procure a kind of cabbage; and of the fibres of the leaves they compose their brooms. Every doofoon or village is furrounded with a number of coconut trees, where the foil and air will fuffer them to grow, and near the bazars, or fear port

port towns, where the concourse of inhabitants is much greater, there are always large plantations of them, to supply the extraordinary demand.

This tree, in all it's species, stages and parts, has been so elaborately, minutely and justly described by many writers, especially the celebrated Rumphius in his Hortus Amboinienfis, that it would be mere repetition in me to attempt a scientific account of it. I shall therefore only add a few detached observations on it's growth. It thrives best in a low fandy foil, near the sea, where it will produce fruit in four or five years. In clayey ground it feldom bears under feven to ten years. As you recede from the coast the growth is proportionably slow, owing to the greater degree of cold in the hills, which is it's feverest enemy; and it must attain there nearly it's full height before it is productive, whereas in the plains, a boy can generally reach it's first fruit from the ground. Here, faid a dupatty, if I plant a coconut or dooreen tree, I may expect to reap the fruit of it, but in Laboon (an inland diffrict) I should only plant for my great grand children. This very tedious growth may feem exaggerated, but it was repeatedly afferted to be, duo, teego gaylair orang (two or three generations) before the coconut trees arrived at complete maturity; and in some parts of the island, where the land is particularly high, I have been affured that neither those, the betel nut, or pepper vines, will produce fruit at all.

It has been remarked by some writer, that the great palm tree (phænix, or palma dastylifera) and the coconut tree, are never sound to flourish in the same country. However this may hold good as a general affertion, it is a fact that not one tree of that species grows on the island of Sumatra, although the coconut and many other varieties of the genus abound there.

All the small islands which lie off the coast are skirted, near the sea beach, with eoconut-trees growing so thick together that they almost choke each other, whilst the interior parts are entirely free from them. This beyond a doubt, is occasioned by the accidental floating of the nuts

U

to the shore, where they are planted by the hand of nature, shoot forth, and bear fruit; which falling, as it comes to maturity, springs up in like manner, and causes a successive reproduction*. Some of these islands, particularly Poolo Mego, one of the southernmost, are uninhabited, except by rats and squirrels, who feast without controll upon the coconuts, unless when disturbed by the crews of vessels from Sumatra, which go thither occasionally, to collect loadings for market. The sea-coconuts, which are known to be the production of islands that lie north-east of Madagascar, are sometimes shoated as far as the Malay coasts, where they are supposed to be natives of the ocean, and were held in high veneration for their miraculous effects in medicine, till a large cargoe of them was a few years since brought to Bencoolen by a French ship, when their character fell with their price.

Betel nut, and other vegetables of domeftic ufe. Of the Penang or betel nut tree, which in growth and appearance is not unlike the coconut, the natives make large plantations, as well as of the Seeree, a creeping plant, whose leaf, of a strong aromatic flavor, they eat with the betel nut and other additions: a practice which I shall hereafter describe. Chili or cayenne pepper, which is much used in their curries and with every article of their food, always constitutes a part of their irregular and inartificial gardens. Turmeric (curcuma) a yellow root well known in our shops, is likewise universally cultivated. It is of two kinds, the one called cooniet mera, for domestic use, being also an ingredient in their curries, pilaws and sundry dishes: the other, cooniet summoo, is an excellent yellow dye, and is sometimes employed in medicine. The coriander and cardamum plants grow in the country in great abundance. The latter is called by the natives pooab lake. There are many species of the pooah, the commonest of which has extraordinary large leaves, like the plantain, and possesses an aromatic quality, not un-

^{*} A few coconuts have been driven by the sea to some parts of the coast of Madagascar, where they are not indigenous, as I was affured by a native, who told me their language had no name for them Rumphius says they are called Voanion (book nior) a corruption of the Sumatran name. They seem to have been little if at all known to the ancients, though said by Theophrastes to have been produced in Egypt.

like that of the bay. Ginger is planted in small quantities. It is called fepudday; which name occasions me to remark, that in the Malay language, they use the word "pudday" to express that pungent, acrid quality in pepper and other spices, which we vaguely denote by the word " kot", which has another fignification totally different. A dish high feafoned, may, according to our mode of expression, be at the same time hot and cold. Costus arabicus and amomum zerumbet are cultivated for medicinal purposes, as is also the galangale. Small plantations of tobacco, of the fame species with the Virginia, are to be meet with every where in the country, but the people are not expert in the method of curing it, else there is no doubt but it might be brought to great perfection, and by encreasing the quantity, rendered a confiderable object of trade. It is cut, whilst green, into fine shreds and afterwards dried in the fun. Benjan (felamum) is fown largely, especially in the Pasfummah country, for the oil it produces, which is used in burning only. The palma Christi (jarak) from whence the castor oil, so much prized, is extracted, grows wild in abundance. The natives are fond of the fugar cane, which they cut into joints, and chew as a delicacy, but they rarely express, or manufacture its juice. Their fugar or jaggree* is made from a liquor yielded by the Anou, a species of palm. They plant the kratou, mulberry, but of a drawf kind, for the use of the filk worms which they rear, but not to any great extent, and the raw filk produced from them feems of an indifferent quality. The filk is in general white instead of yellow, and the filaments appear coarse, but this may be partly occasioned by the method of loosening them from the bags, which is by steeping them in hot water. The samples I have seen were in large flat cakes which would require much trouble to wind off. Calooee is a species of nettle, of which excellent twine, not inferior to ours, is made. It grows to the height of about four feet, without branches, the stem being imperfectly ligneous. It is cut down, dried and

^{*} If the ancients were acquainted with fugar, it was produced from some species of the palm, as the sugar canes were not brought into the Mediterranenan from the east, 'till a short time before the discovery of the passage to India by the Cape: The word facebarum is conjectured to be derived from jaggree, which the French pronounce schagaree.

beaten; after which its rind is stripped off, and twisted as we do hemp. Twine is also made of the bark of a shrub called Endeeloo. The cannabis or hemp, called ganjo by the Malays, is cultivated in quantities, not for the purpose of making rope, which they never think of applying it to, but for smoking, and in that state it is called bang, and has an intoxicating quality. Palass is a shrub, with a blossom much resembling our hawthorn in appearance and fmell. Its leaf has an extraordinary roughness, on which account it is employed to give the last fine polish to their carvings in wood and ivory, particularly the heads and sheaths of their creefes or daggers, which they are remarkably curious in. The leaf of the Seepeet also having the same quality, is put to the same use. A twine is made in the Lampoon country of the bark of the Baroo tree, beat out like hemp, for the construction of large fishing nets. The younger leaves of this tree are effected delicate in curries. On the island of Neas they make a twine of the Baroo tree, which they afterwards weave into coarse cloth for bags. A kind of thread for sewing is procured by stripping filaments from the midribs of the leaves, and the trunk of the Pesang or plantain, and I understand that it is in some parts worked in the loom. Marcongaye: the root of this shurb, which grows high, with pinnated leaves, has perfectly the appearance, flavor and pungency of horseradish, and is used in the same manner. Eeni: this is a fhrub with a finall, light green leaf, which yields an expressed juice of a red color, with which the natives tinge the nails of their hands and feet. Cachang goring: these are the granulose roots of an herb, which refembles the clover, but that the leaves are double only instead of treble, and affording, like that, the richest pasture for cattle. The bloffom is papilionaceous and yellow. The chachang (which is likewife the general name for pulse) are always eaten fried, from whence the epithet of goring, and prove an agreeable carminative. The natives plant yams of different kinds and remarkably fine; fweet potatoes, which those who are used to grow are very fond of; pulse of various forts, particularly a species of French bean, that grows high. and lasts for several years: the brinjals (of which the egg plant is one fpecies) were probably introduced from China, but are much eaten by the natives, split and fried. Their attention to their gardens, however, is

very limited, owing to the liberality with which nature, unfolicited, administers to their wants. Maize (jaggong), though very generally planted here, is not cultivated in quantities, as an effential article of food. The ears are plucked whilst green, and being slightly roasted, are eaten as a delicacy. Pacoo beendoo resembles a young dwarf coconut tree, and is probably of that species. The stem is short and knobby, and the lower parts of each branch prickly. The young shoots are much esteemed in curries. It produces a cabbage like that of the coconut and neebong, which is a fine culinary vegetable. Its flower is yellow. Though ranked by the Malays, and by Rumphius, inthe class of ferns, it has no obvious affinity to them. The neebong or cabbage tree, a species of palm, grows wild in too great abundance to require being cultivated. The pith of the head of the tree is the part eaten. The stem, which is tall and streight, like the coconut, is much used for posts of slight houses, being of a remarkably hard texture on the outer part. Within fide it is quite foft, and therefore, being hollowed out, it is often used as gutters or channels to convey water. Anou: This is a tree of the palm kind also, and of much importance, as the natives procure from it Sago, (but there is also another fago tree more productive); toddy or palm wine, of the first quality; sugar or jaggree, and ejoo. The leaves are long and narrow, and though naturally tending to a point, are never found perfect, but always jagged at the end. The fruit grows in bunches of thirty and forty together, on strings three or four feet long. One of these strings being cut off, the part of the shoot remaining is tied up, and then beaten; afterwards an incifion in it is made, and a veffel closely fastened, usually of bamboo. into which the toddy (neeroo) distills. The ejoo, exactly resembling coarfe, black horse hair, and used like it, among other purposes, for making ropes, and mixing with mortar, encompasses the stem, and is feemingly bound on by thicker fibres or twigs, of which the Malays make pens for writing,

Indigo (taroom) being the principal dye-stuff employed by the natives, Dye-stuffe, that shrub is always found among their plantations, but they do not ma-

nufacture it into a folid substance, as is done elsewhere in the East and West Indies. They leave the stalks and branches for some days in water to foak and macerate, then boil it, and work with their hands fome chunam (quick lime) among it, with leaves of the pacoo fabba (a species of fern) for fixing the color. They then drain it off, and use it in the liquid state. There is another kind of indigo (tarroom akkar) which appears to be peculiar to this country, as I shewed some of the leaves to botanifts of the most extensive knowledge, who informed me that they were totally unacquainted with it. The common kind is known to have finall, pinnated leaves, growing on stalks imperfectly ligneous. about five feet high. The tarroom akkar, on the contrary, is a vine or creeping plant, with leaves four or five inches long, in shape like a laurel, but finer, and of a dark green. It possesses the same qualities, and produces the same color with the other fort; they are prepared in the fame manner, and used indifcriminately, no preference being given by the natives to one above the other, except that the akkar, by reason of the largeness of the foliage, yields a greater proportion of sediment. I conceive that it must be a valuable plant, and have written to my friends on Sumatra to transmit me specimens of the flowers and feed, that it's identity and class may be accurately afcertained. Lot : (eviduberg arom

Sappang (sapan or Brasil wood). The heart of this being cut into chips, steeped for a considerable time in water, and then boiled, is used for dying here, as in other countries. The cloth or thread is repeatedly dipped in this water, and hung to dry between each wetting, till it is brought to the shade required. To fix the color, taway (allum) is added in boiling.

Maccodoo (morinda citrifolia). A tree, the outward parts of the root of which, being dried, pounded, and boiled in water, afford a red dye; for fixing which, the ashes yielded by the stalks of the fruit and midribs of the leaves of the coconut, are employed. Sometimes the bark of the besappang tree is mixed with the roots of the macoodoo.

courfe, black herfe hair, and used like it, an

that fitrab is always found among their plantations

Chepudda (jack tree). The roots are cut into chips, and when bolled in water produce a yellow dye. A little of the coniet (turmeric) is mixed with it, to strengthen the tint, and allum, to fix it.

Cadarang is used as the jack tree. These yellow dyes do not hold well, and it is therefore necessary, that the operation of steeping and drying should be frequently repeated.

A black dye is made from the coat of the mangusteen fruit, and bark of the katapping or walnut. With this, the blue cloth from the west of India, is rendered black, as usually worn by the Malays of Menangcabow. It is steeped in mud to fix the color. A shrub called kattam by the Moosee people, and by the Malays, timboo akkar, yields also when boiled, a black dye, which, it is thought, if it could be manufactured like indigo, might turn to valuable account, as a vegetable black dye is said to be much wanted.

Ochar is a red wood which is used for tanning fishing nets. It much resembles the logwood of Honduras, and might probably be employed for the same purposes.

Cassomboo. This is the bixa, from which in the West Indies, the arnotto, a valuable dye, is procured. I brought home with me, and shewed to the late Dr. Solander, some of the seed vessels and leaves, who affured me it was the true arnotto: yet the natives of Sumatra say that it is only an inferior kind, and that the best sort comes from Java. They call theirs cassomboo ayer, which addition signifies water, and is used in other instances to express a bastard species; or perhaps it may only denote it's growing in marshy places. Of the Javan, or genuine fort, as they call it, the flowers are said to be used, and the color it gives is a shade of pink. In the Sumatran species, the seeds afford the dye, which is a yellowish scarlet. The former is, according to Rumphius, the slowers of the carthamus indicus, and in a Batavian catalogue, I observe that a distinction is made between "cassomboo," which they call "carthamus."

"thamus," and caffoomboo kling" (Teling or Coromandel) which they term "bixa". The leaf of the tree is four inches in length, broad at the base, and tending to a sharp point. The capsule, about an inch in length, is covered with soft prickles or hair, opens like a bivalve shell, and contains in it's cavities a dozen or more seeds, about the size of raisin stones, surrounded thick with a reddish farina, which seems the only part that constitutes the dye.

The Sumatrans are acquainted with no purple dye stuff, nor apparently are any of the Indian nations.

In the Mobile people, and by the Miles, Index actor, yields also when boiled, a block do a, which, it is decemb, if it could be manufactured like maign turk to valuable account, as a vegetable black

we've find to be much winted.

Octor is a red wood which is add for tanging allting ners. It much resemble s the logwood of Hondars, and might probably be employed

Fruits.

more, a valuable due, is precured. I brought home with me, and shewed to the late Dr. Solander, teme of the feed velicle and leaves, who assured me is was the order emotto; yet the natives of Samatra fly that it is only an inferior kind, and that the both for comes from Java. They call theirs estheomico or , which addition from its water, and is used in other inflances to exprefs a baffard spaces; or perhaps it may only denote it's growing in marthy places. Of the Javan, or genuine to t, as they call it, the sovers are faid to be used, and the color it gives is a

thate or prox mires command to color, the Rumphius, the is a section of the cardbonus indicas, and in a let vian caralogue, I oblerve

that a diffinction is made between " enfloomboo," which they call " care

Fruits, Flowers, Medicinal Shrubs and Herbs.

ATURE, fays a celebrated writer, feems to have taken a pleafure in affembling in the Malay islands, her most favorite productions"and with truth I think it may be affirmed, that no country upon earth can boast an equal abundance and variety of indigenous fruits; for though the whole of the following lift cannot be reckoned as fuch, yet there is every reason to conclude that by far the greater part may, as the natives can hardly be suspected of having taken much pains to import exotics, who never appear to bestow the smallest labor, in improving, or even cultivating, those which they possess. The larger number grow wild, and the rest are planted in a careless, irregular manner, without any inclosure, about the skirts of their villages.

The Mangusteen (mangees) has, by general confent, obtained the preeminence amongst Indian fruits, in the opinion of Europeans. It is the pride of the Malay islands, and perhaps the most delicate fruit in the world; but not rich or luscious. It is a drupe, confisting of a foft, fucculent, and thick rind, encompassing kernels which are covered with a juicy, and perfectly white substance, which is the part eaten, or fucked rather, as it diffolves in the mouth. They are extremely innocent in their qualities, and may be eaten in any quantity without danger of a furfeit, or other bad effects. The returns of its feafon are very irregular.

The Doorean. This is the favorite of the natives, who live almost wholly upon it, during the time it continues in feafon. It is a rich fruit, but strong in the taste, offensive in the smell to those who are not accustomed to it, and of a very heating quality. The tree is large and lofty; the leaves are fmall in proportion, but in themselves long and pointed. The bloffoms grow in clusters, on the stem and larger branches. The petals are five, of a yellowish white, surrounding five bunches of stamina, each bunch containing about twelve, and each stamen having four

antheræ.

antheræ. The pointal is knobbed at top. When the stamina and petals fall, the empalement resembles a sungus, and is nearly the shape of a Scots bonnet. The fruit is not unlike the bread fruit, but larger and rougher on the outside.

The jack (choopada). This is distinguished into the choopada cotan, and nanko. The former is scarce and esteemed preferable. The leaves are smooth, pointed, rare. The nanko, or common fort, has roundish leaves, resembling those of the cashew tree. In both forts, the fruit grows from the stem, and is very large, weighing sometimes half an hundred weight. The outer coat is rough, containing a number of seeds or kernels, (which when roasted eat like chesnuts), inclosed in a slessly substance, of a rich, and to strangers, too strong smell and slavor, but which gains upon the taste. As the fruit ripens, the natives cover it with mats or the like, to preserve it from injury by the birds. Of the juice of this tree they make bird lime, and the root yields a dye stuff.

Sookoon. Calawee. Two species of the bread fruit tree. The former has no kernels, and is the genuine fort. It is propagated by cuttings of the roots. Though pretty common, it is said not to be a native of the island, as the calawee certainly is, the bark of which affords the inhabitants their cloth. They cut the bread fruit in slices, and eat it boiled or fried, with sugar, esteeming it much. I have frequently tasted of it. The leaves of both forts are deeply indented, like those of the sig, but considerably longer.

Billimbing. Of this there are two forts, called jooroo and beffee. The leaves of the latter are small and pinnated, of a sap green: those of the former grow promiscuously, and are of a silver green. The fruit of both is pentagonal, containing sive flattish seeds, and extremely acid. The blossom resembles the slower we call London pride. Cheremin. This resembles the billimbing bessee, in having the leaves pointed and pinnated alternate. The fruit is acid, and of a small roundish, irregu-

lar shape, growing in clusters close to the branch, and containing each a fingle seed.

Lanfai. The tree which bears this fruit is large; the leaves are of a lightish green and somewhat pointed. The fruit is small, oval, of a light brown; divides into five cloves, slessly, and of an agreeable taste; but the skin contains a clammy juice, extremely bitter, and which is apt to taint the fruit, if not opened with care. Ayer ayer. This is not unlike the lansai. The Choopa is also nearly allied to it.

Brangan. This fruit, the produce of a large tree, strongly resembles the Chesnut, and is I think a species of it. They grow sometimes one, two, and three in a husk. Ferring. This also seems a species of the chesnut, but is larger and more irregularly shaped. The tree is smaller than the former. Tappoos. This has likewise a distant resemblance to the chesnut; has three nuts always in one husk, forming in shape an oblong spheroid. If eaten unboiled, it is said to inebriate. The tree is large.

Cameeling or booa cray. This much refembles a walnut, in the flavor and confistence of the fruit; but the shell is harder, and it is not divided into lobes in the same manner, nor does the shell open, being all of one piece. The natives of the hills make use of it for their curries, in parts where the coconut will not produce fruit.

Katapping. This fruit, the produce of a large tree, is extremely like the almond, both in the outer husk and the kernel within, excepting that the latter, instead of splitting into two, as an almond readily does, is folded up as it were, and opens somewhat like a rose bud, but continuous and not in distinct pieces.

Sala. The pulp of this fruit is sweetish, acidulous, and of a pleasant flavor. The outer coat, in shape like a sig, is covered with scales, or the appearance of basket work. When ripe it is of a dark brown. It encloses

encloses fometimes one, two, and three kernels, of a peculiar horny subflance. The tree is low and thorny.

The outer skin, which is very fine, is of a beautiful red, and the inside persectly white. When ripe it is delicious eating, and has more substance than the generality of India fruits. In smell it resembles the rose, and the taste partakes slightly of that slavor. There is one species of it, which is called the rose-water jamboo. Nothing can be more beautiful than the blossoms, the numerous stamina of which are of a bright pink color. The tree, which grows in a handsome, regular, conical shape, has large, deep green, and pointed leaves. Jamboo ayer, is a delicate and beautiful fruit in appearance, being a mixture of white and pink. It is smaller than the jamboo mera, and not equal in its slavor, which is a faint agreeable acid. The leaf is a deep green, pointed and unequal.

Rambootan. The flavor of this fruit is a rich and pleasant acid. It is red, and covered with soft spines or hair, from whence its name. In appearance it is not unlike the arbutus, but larger, brighter red, and more hirsuted.

Besides those which I have attempted to give some description of, the sollowing sine fruits are in great abundance, and to persons who have been in any part of India, in general well known. The Mango, by many esteemed an unrivalled fruit, is richer, but of a less delicate and elegant slavor than the mangusteen. The Plantain, pesang, or Indian sig, of which there are counted upwards of twelve varieties, including the banana. The Pine-apple ('nanay). These grow in great plenty without the smallest degree of culture, further than sticking the plants in the ground. Some think them inserior to those produced in Europe, but probably because their price is no more than two or three pence. With the same attention, they would doubtless, be much superior, and their variety is very great. Oranges (leemou) of every species are in extreme persection. The Pumplenose, or Shaddock (so called in the West Indies

from

from the name of the captain who carried them thither) is here very fine, and diftinguished into the white and red forts. Limes and lemons are abundant. The Guava or jamboo protoccal, as the Malays call it, is well known in the west of India, for a flavor which some admire, and others equally diflike. The infide pulp of the red fort is fometimes mixed with cream by the Europeans, to imitate strawberries, as we are naturally partial to what refembles the produce of our own country. Many I have known, amidst a profusion of the richest eastern fruits, to figh for an English codling or gooseberry. Custard apple, (seeree cayoo), derives it's name from the likeness which it's white and rich pulp bears to a custard, and it is accordingly eaten with a spoon. The Pomegranate (nulleemou) requires no comment. The Papa (caleekee) is a large, fubftantial, and wholesome fruit, but not very highly flavored. The pulp is yellow, and the feeds, which are about the fize of a grain of pepper, have a hot taste like cresses. The Cashew apple and nut (jambooeerong) are well known for the strong acidity of the former, and the caustic quality of the oil contained in the latter, from tasting which the inexperienced often suffer. Rock or musk melons are not common, but the water melons are in great plenty. Tamarinds (affam), which are the produce of a large and noble tree, with small pinnated leaves, fupply a grateful relief in fevers, which too frequently require it. The natives preserve them with salt, and use them as an acid ingredient in their curries, and other dishes. It may be remarked, that in general they diflike fweets, and always prefer fruits whilst green; excepting perhaps the doorean and jack; to the fame in their ripe state: the pine apple they eat with falt. Grape vines are planted with fuccess by the Europeans, but are not cultivated by the people of the country. There is found in the woods a species of wild grape, called pringat; and also a fruit that resembles the strawberry.

The following fruits growing mostly wild in the country, are not equally known with those already enumerated, yet many of them boast an exquisite flavor. Booa candees (booa fignifying fruit, is always prefixed to the particular name) malacco, tampooee, rotan, neepab, reocum, rumpunni,

rumpunni, kuddooee, muncoodoo, fuccoodoodoo, keetapon, embachang, tais, leffay, aman. Some of them however are little fuperior to our common berries, but probably might be improved by culture.

Flowers.

"You breathe, in the country of the Malays; fays the writer whom I before quoted; an air impregnated with the odours of innumerable flowers of the greatest fragrance, of which there is a perpetual succeffion the year round, the sweet flavor of which captivates the soul, and inspires the most voluptuous sensations." Although this luxurious picture may be drawn in too warm tints, yet it is not without it's degree of justness. The country people are fond of flowers in the ornament of their persons, and encourage their growth, as well as that of various odiriferous shrubs and trees.

The canango, being a tree of the largest fize, and surpassed by few in the forest, may well take the lead, on that account, in a description of those which bear flowers. These are of a greenish yellow, scarcely distinguishable from the leaves, and seem to open only at sun-set, when they disture a fragrance around, that of a calm evening affects the senses at the distance of many hundred yards.

Choompaco (michelia). This tree grows in a regular, conical shape. The flowers are a kind of small tulip, but close and pointed at top: the color a deep yellow: the scent strong, and at a distance very agreeable. They are wrapped in the folds of the hair, both of women and young men, who aim at gallantry.

Sangelappo. Pretty shrub. The leaves very deep green, with a long point. The flowers white, of the pink kind, but without visible stamina or pistil, the petals standing angularly like the sails of a windmill. Pichar peering. This is a grand white slower, and bears the same relation to the foregoing, that the carnation does to the common pink. The Batavian catalogue calls it clerodendrum.

Boongo rio. Tall, handsome shrub. The flower red, with juice of a deep purple; called also the shoe flower, from the purpose it's juice has often been converted to by Europeans. Another fort has white slowers. The leaves of the tree are of a pale, yellowish green, ferrated and curled.

Coombang anoojoor. This is always planted about graves. The flower is large, white, but yellow towards the center, of a strong scent, and consisting of sive simple, smooth, thick petals, without visible pistil or stamina. The tree grows in a stunted irregular manner, and even whilst young, has a venerable, antique appearance. The leaf is long, pointed, of a deep green, but most remarkable in this, that the sibres which run from the mid rib, are bounded by another that goes in a waving line all round, within a small distance of the circumference, forming a kind of border.

Salandap (crinum or asphodel lily). It grows in a large umbell; each slower on a long footstalk, which divides into six large, white, turbinated petals, of an agreeable scent. The stamina are six in number, about two inches long. The leaves are of the spear kind, of a large size. This plant grows wild upon the beach, among those weeds which bind the loose sands. The Batavian catalogue calls the crinum, bacong. Pandam congey. A beautiful species of the salandap. The generic marks are the same, but it is larger, and has a deep shade of purple mixed with the white.

Of the pandan, which is a fhrub with very long prickly leaves, like those of the pine apple or aloe, there are many varieties; of which one produces a whitish blossom, a foot or two in length, which has not much the appearance of a flower, but has a very strong odoriserous smell, which is perceived at a great distance. The common kind is employed for hedging.

The Mellocr or melattee (nyctanthes) is an humble plant, bearing a pretty white flower, of the most agreeable scent, in the opinion of many,

that the country produces. It is much worn by the women, along with the boongo tanjong, and always planted near their houses. It may be remarked that "boongo," or flower, is always prefixed to the names of these, as "bcoa" to the fruit. Thus the natives say, boongo melloor, bcongo rio.

Tanjong. A fair tree, rich in foliage, of a dark green: The flowers are radiated, and of a yellowish white. They are worn in wreaths by the women. The scent, though exquisite at a distance, is too powerful when brought nigh. The fruit is a drupe, enclosing a large, blackish, flatted seed.

Soundal mallam, or harlot of the night, from the circumstance of it's blowing only at that time. This is a monopetalous, infundibuliform, white flower, of the tuberose kind. The tubes which rise from the single stem, divide into six, deep segments, pointed, slightly reslexed, and placed alternately under and over. The stamina, which are six, adhere closely to the inside of the tube, their apices only being free. The style rises from the germen only half way in the tube, separating at top into three stigmata.

Geering landa. A papilionaceous flower refembling the lupin, or the spartium more exactly. It is yellow, and tinged at the extremes with red. The leaves are broad, pointed, and treble on each stalk. The seed rattles loudly in the pod, from whence the name; "geering" signifying the small bells worn by children about their legs and arms: "landa" is a hedgehog, to the spines of which animal they probably may sometimes adhere.

Daoup. A white, homely flower; femiflosculous; faint smell. The leaves of the plant are curious, being double, as if two were joined together, and folding with a hinge. The pod resembles the French-bean, and contains several flat seeds.

Tabeong broo, or monkey-cup. A vine with an uncommon, monopetalous flower, growing on a tendril from the extremity of the leaf, in shape somewhat like the pod of a Windsor-bean. At top is a cover, or valve, which opens and shuts with a hinge, but usually remains open, and as the cup is always erect, it is found full of water, from the rains or dews.

Imbang. A shrub, of which the leaf is small, light green, of an irregular figure. The flower is a light purple, with five yellow stamina. The fruit is very small, round, whitish, and bitter, but eaten by the natives.

Cachoolong (datura) Large white flower; monopetalous, infundibuliform, rather pentagonal than round, with a small hook at each angle. The stamina are five with one pointal. The shrub has much foliage; the leaves dark green, pointed, and square at the bottom. The fruit is of the shape of an apple, very prickly, and contains a multitude of seeds. It appears to grow mostly by the sea side.

Setacko. A pretty rofaceous, crimfon flower, with five small petals, and as many stamina. It is a long tube, growing from a calyx covered with purple hair.

Westcoast creeper. I know not the country name. A beautiful little, crimson, monopetalous flower, divided into five angular segments. It has five stamina of unequal heights, purple, and one style, white, with a biform, rough stigma. The plant is a luxuriant creeper, with a crinated or hairlike leaf. The flower closes at sunset.

The scorpion flower is singular and remarkable. In it's shape it very much resembles the insect from which it takes it's name, and the extremity of the tail has a strong smell of musk.

The foregoing is but an imperfect account of the flowers which are of the growth of Sumatra. Befide those, there are abundance, of A a which

which it is difficult to determine, whether they are indigenous or exotics: fuch as the rofe, or boongo mowar, which is always small, of a deep crimson color, and probably transplanted from the west of India: the globe amaranthus, which is found in great plenty in the Batta country, where strangers have very rarely penetrated: various kinds of pinks: the jessamine: holyhock; with many others which seem to have had their origin from China.

Indexe. A flereb, of which the leaf is small, light

The Sumatrans have a degree of botanical knowledge that surprizes an European. They are in general, and at a very early age, acquainted, not only with the names, but the qualities and properties of every shrub and herb, amongst that exuberant variety with which these islands are clothed. They distinguish the sexes of many plants and trees; (the papa or caleekee for instance); and divide several of the genera into as many different species as our professors. Of the pacco or fern, I have had specimens brought me of twelve varieties, which they told me were not the whole, and to each there is a distinct name.

Medicinal fhrubs and herbs. The fhrubs and herbs employed medicinally are as follow. Scarce any of them are cultivated, being culled from the woods or plains as they happen to be wanted.

Lagoondee. This shrub grows to the height of five or fix feet. The slower is small, monopetalous, divided into five segments, labiated; grows in the manner of London-pride, with fix or seven on each peduncle; the color light blue; has four stamina, and one style. The leaves are spear-shaped; three on one common footstalk, and that in the middle being longest, it has the appearance of a hastated leaf: deep green on the inside and whitish on the back. The leaves have a strong, aromatic flavor, their taste somewhat resembles that of the black currant, but is bitter and pungent. It is esteemed a fine antiseptic, and employed in fevers, in the stead of jesuit's bark. The natives also put it into granaries, and among cargoes of rice, to prevent the destruction of the grain by weevils.

Katoopong.

Katoopong. Resembles the nettle in growth; it's fruit, the blackberry. The leaf, being chewed, is used in dreffing small, fresh wounds. Seeup. Bears the refemblance of a wild fig, in leaf and fruit. It is applied to the Neas fourf or leprofy, when not inveterate. Succoodoodoo. Has the appearance of a wild rofe. A decoction of it's leaves is used for curing a diforder in the fole of the foot, refembling the ringworm, called maltoos. Padoovrooang. An herb with a pointed, ferrated leaf, bitter almost as rue. An infusion of it is taken for the relief of disorders in the bowels. Caboo. The bark and root are applied to cure the coodees or itch, rubbing it on the part affected. Marampooyan. The young shoots of this, are rubbed over the body and limbs after violent fatigue, having a refreshing, and corroborating quality. Malee malee. Plant with a white, umbellated bloffom. The leaf is applied to reduce swellings. Chappo. Wild fage. It refembles the fage of Europe, in color, tafte, finell and virtues, but grows to the height of fix feet, and has a large, long and jagged leaf, with a bloffom refembling that of groundfil. Murreebcongan. A vine. The leaves broad, roundish and smooth. The juice of the stalk is applied to cure excoriations of the tongue. Ampi ampi. A vine, with leaves refembling the box, and a small flosculous flower. It is used as a medicine in fevers. Cadoo. An herb. The leaf in shape and tafte refembles the betel. It is burned to preferve children newly born from the influence of evil spirits (7in). Goombay. A shrub with monopetalous, stellated, purple flowers, growing in tufts. The leaves are used in disorders of the bowels. Taboolan boocan. A shrub with a semiflosculous flower, applied to the cure of fore eyes. Cachang parang. A bean, the pods of which are of a huge fize: the beans are of a fine crimson. Used in pluretic cases. Seepeet. A shrub with a large oval leaf, rough to the touch and rigid. An infusion of it is drank in iliac affections. Daoun sedingin. Leaf of a remarkable cold quality. It is applied to the forehead, to cure the head-ach, and fometimes in hot fevers.

Long pepper is used for medicinal purposes. Turmeric also, mixed with rice, reduced to powder, and then formed into a paste, is much used outwardly, in cases of colds, and pains in the bones; and chunam,

or quicklime, is likewise commonly rubbed on parts of the body affected with pain.

In the cure of the boss, or cooroo; which is an obstruction of the spleen, forming a hard lump in the side, and giving rise to a species of sever, called dummum cooroo; a decoction of the sollowing plants is externally applied: seepeet toongool; madang tando; attee ayer; tappar bessee; pacoo teang; tappar badda; labban; pesang rooco; and pacoo lameedeen. A juice extracted from the Malabattaye akkar, is taken inwardly.

In the cure of the *pooroo*, or ringworm, they apply the *galengang*, an herbaceous fhrub, with large, pinnated leaves, and a yellow blofform. In the more inveterate cases, *barangan*; which is a species of colored arfenic or orpiment, and a strong poison; is used.

The white milky juice that flows from the *Judufudu*, or Euphorbium, when an incision is made, the natives value highly as a medicine. The leaf of the tree is present death to sheep and goats.

Animals.

Animals—Beasts—Birds—Reptiles—Insects.

THE animal kingdom should claim attention, but the quadrupeds Animals, of the island being the same as are found elsewhere throughout the east, already well described, and not presenting any new species that I am acquainted with, I shall do little more than simply furnish a list of those which have occurred to my notice; adding a few observations, either here, or in the suture course of the work, on such as may appear to require it. The carbow, or Malay bussaloe, being an animal particularly belonging to these parts, and more serviceable to the country people than any other, I shall enter into some detail of its qualities and uses.

Horse: coodo. The breed is small; well made, and hardy. Cow: Beasts.

sappee. Small breed. Buffaloe: carbow. A particular description will follow. Sheep: beeree-beeree. Small breed, introduced probably from Bengal. Goat: cambing. Befide the domestic species, which is in general finall, and of a light brown color, there is the cambing cotan, or goat of the woods. One which I saw was three feet in height, and four feet in the length of the body. It had fomething of the gazelle in its appearance, and, excepting the horns, which were about fix inches long, and turned back with an arch, it did not much refemble the common goat. The hinder parts were shaped like those of a bear, the rump sloping round off from the back. The tail was very small, and ended in a point. The legs clumfy. The hair, along the ridge of the back, rifing coarse and strong, almost like briftles. No beard. Over the shoulder was a large spreading tuft of greyish hair: The rest of the hair black throughout. The fcrotum globular. Its disposition seemed wild and sierce, and it is faid by the natives to be remarkably swift. Hog: babee. That breed which we call Chinese. Dog: angin: cocyoo. Curs with erect ears. Cat; cochin. All their tails imperfect and nobbed at the end, as if cut, or broken off. Rat: teecoofe. Elephant: gaja. Spoken of in another part. Rhinoceros: buddah. Hippopotamus: coodo-ayer. reemow: machang. Spoken of in another part. Bear; broorong. Small

and black; devours the hearts of the coconut trees. Otter: angin-ayer. Sloth. Stinkard: teleggo. Porcupine: landa. Armadillo: tangeeling. It perfectly refembles the animal of America. Very rare, and made great account of by the natives; the scales being supposed medicinal. Deer: rooso: keejang. There are variety of the deer species; of which some are very large. Wild hog: babee ootang. Hog deer: babee rooso. Small and delicate animal; one of those which produce the bezoar. Monkey: moonia: broo: seermang. Prodigious variety of this genus. Pole cat: moosang. Tiger cat: cochin-reemow. Civet cat: The natives take the civet from the vagina of these, as they require it for use. Squirrel: toopye. Small, dark species. Bat: boorong-teecoofe. Many of considerable size, which pass in large slocks from one country to another; hanging at times, by hundreds, on trees. Some perfectly resemble soxes, in shape and color; but these cannot sly far.

Buffaloe.

The buffaloe (carbow), which constitutes a principal part of the food of the Sumatrans, is the only animal employed in their domestic labors. The inland people, where the country is tolerably clear, avail themfelve of their strength, to draw timber felled in the woods: the Malays, and other people on the coast, train them to the draft, and sometimes to the plough. Though apparently of a dull, obstinate, capricious nature, the carbow acquires by habit a furprizing docility, and is taught to lift the shafts of the cart with its horns, and place the yoke, which is fixed to those, across its neck; needing no further harness than a breast band, and a string which is made to pass through the cartilage of the nostrils. They are also, for the service of the Europeans, trained to carry burthens suspended from each fide of a pack faddle, in roads or paths where the use of carriages is impracticable. It is extremely flow, but steady in its work. The labor it performs, falls short of what might be expected from its fize, and apparent strength, the least extraordinary fatigue particularly during the heat of the day, being fufficient to put a period to its life, which is at all times precarious. The owners frequently experience the loss of large herds, in a short space of time, by an epidemic distemper, called boondoong, that seizes them suddenly, swells their bo-

dies,

dies, and gives way to no remedy yet discovered. The most part of the milk and butter required by the Europeans; the natives using neither; is supplied by them; and the milk is richer than what is there produced by the cow; but not in the same quantity.

Though we have given to the carbow, the name of buffaloe, it is an animal very different from that known in the fouthern parts of Europe, by the same appellation, from the hide of which the buff leather is supposed to be manufactured. This, from the description given in some of our books of natural history, resembles what we call in India, the Madagascar bull; especially in the fleshy protuberance rising from the neck; and extending over the shoulder. The carbow is a beast of greater and more equal bulk, in the extent of the barrel. The legs are shorter than those of the ox; the hoofs larger; the horns, which usually turn backward, but fometimes point forward, are always in the plane of the forehead, differing in that respect from those of all other cattle. Excepting near to the extremities, the horns are rather square than round; contain much folid substance, and are valuable in manufacture. The tail hangs down to the middle joint of the leg only, is small, and terminates in a bunch of hair, which is very rare in all parts of the body; fearcely ferving to cover the hide. The neck is thick and finewy, nearly round, but somewhat flatted at top; and has little or no dewlap dependant from it. The organ of generation in the male, has an appearance, as if the extremity were cut off. It is not a falacious animal. The female goes nine months with calf, which it fuckles during fix, from four teats. When croffing a river, it exhibits the fingular fight, of carrying the young one on its back. It has a weak cry, in a sharp tone, very unlike the lowing of oxen. to earnesh vd botsoilleanob bus the

The luxury of the carbow confifts in rolling itself in a muddy pool, which it forms in any spot, for its convenience, during the rainy weather. This it enjoys in a high degree, dexterously throwing with its horn, the water and slime, when not of a sufficient depth to cover it, over its back and sides. Their blood perhaps is of a hot temperature, owing to

When they now collect in the woods, they are faid to be

which, this indulgence, quite necessary to their health, may be rendered so desireable to them; and the mud which encrusts on their body, preferves them from the attack of insects, which otherwise prove very troublesome. The natives light fires for them at night, in order that the smoke may have the same effect, and they have, of their own accord, the sagacity to lay themselves down to leeward, that they may enjoy the full benefit of it.

They are distinguished into two sorts; the white and black. Both are equally employed in work, but the former is seldom killed for food. Some of the people say, that this exemption is owing to its being esteemed sacred, but I was affured by a learned padré, that it was neither forbidden by the Koraan, or any religious injunction, and that the Malays eat it, at times, without scruple; esteeming it however, very inferior to the black buffaloe. The Rajangs also have no general exception to it. Some of them eat it; and some refuse, on the same account that induced the Rechabites to drink no wine, and to live in tents; a vow of their sorestathers: whilst others are deterred by the accounts of the ill effects that have attended it; the body being observed to break out afterwards in blotches. Possibly the whiteness of the buffaloe, may be owing to some species of disorder, as is the case with those people called white negroes.

It is faid not to be properly a wild animal of the country, though abounding in every part; which the name of carbow gellan (stray buffaloes), given to those found in the woods, seems to confirm. Most probably they were at first wild, but were afterwards, from their use in labor and food, all catched, and domesticated by degrees, or killed in the attempts to take them. When they now collect in the woods, they are said to be stray cattle; as the people of a conquered province, attempting to recover their natural liberties, are styled rebels. They are gregarious, and commonly sound in numbers together, being then, less dangerous to passengers, than when met with singly. Like the turkey, they have an antipathy to a red color. When wild, they run extremely swift, keeping

pace with the fpeed of a common horse. Upon an attack, or alarm. they fly for a fhort diffance, and then fuddenly face about, and draw up in battle array, with furprifing quickness and regularity; their horns being laid back, and their muzzles projecting. Upon the nearer approach of the danger that preffes on them, they make a fecond flight, and a fecond time halt, and form: and this excellent mode of retreat: which but few nations of the human race, have attained to fuch a degree of discipline, as to adopt; they continue till they gain a neighbouring wood. Their principal foe, next to man, is the tiger; but only the weaker fort, and the females, fall a certain prey to this ravager: the furdy male buffaloe can support the first vigorous stroke from the tiger's paw, on which the fate of the battle usually turns, a belied good good sold live

Of Birds there is a much greater variety than of beafts. To enumerate Birds. the different species is quite beyond my power. The most obvious are as follows: but I do not offer this lift, as containing a tenth part of what might be found on the island, by a person who should confine his refearches to this fubiect. Lyon and oillemon a walnes askalash salash

wild, is the berry of the run-moniced aubtlets therefore to call

The coo-ow, or famous Sumatran or Argos pheafant, of which no complete specimen has been hitherto seen in Europe, is a bird of uncommon beauty; the plumage being perhaps the most rich, without any degree of gaudiness, of all the feathered race. It is found extremely difficult to be kept alive, for any confiderable time after catching it in the woods. I have never known it effected for above a month. It has an antipathy to the light. When kept in a darkened place, it appears at its eafe, and fometimes makes use of the note or call, from which it takes its name, and which is rather plaintive, than harsh like the peacock's. In the open day it is quite moped and inanimate. The head is not equal in beauty to the rest of the bird. The slesh, of which I have eaten, perfectly refembles that of common pheasants, but it is of much larger fize. These alfo abound in the woods.

There and of the bill, of or a Orestered, was ten inches and an

There is a great variety of the flork kind; some of prodigious fize, and otherwise curious; as the boorong cambing, and boorong-colar. Of doves there are are two species; which have many varieties; the one brown, called ballum, and the other green, called pooni. The pooni-jamboo is a very beautiful bird. It is smaller than the usual fize of doves: the back, wings, and tail are green: the breast and crop are white, but the front of the latter has a light shade of pink: the forepart of the head is of a deep pink, resembling the blossom of the jamboo fruit, from whence it's name: the white of the breast is continued in a narrow streak; having the green on one side and pink on the other; half round the eye, which is large, full, and yellow; of which color is also the beak. They will live upon boiled rice, and paddee; but their favorite food, when wild, is the berry of the rum-pooni; doubtless therefore so called.

Of the parrot kind are many species; as the kaykay, cocatoa; parroquet, and loory. There are also, the kite; crow (gagha); plover (cherooling); fnipe; quail (cooyco); wildduck; teal (beleebee); water-hen; lark; fea-lark; curlew; domestic hen (syam), some with black bones, and fome of the fort we call Freezland or negro fowls; hen of the woods (ayam baroogo); the jago breed of fowls, which abound in the fouthern end of Sumatra, and western of Java, are remarkably large: I have feen a cock peck off of a common dining table: when fatigued, they fit down on the first joint of the leg, and are then taller than the common fowls. It is strange if the same country, Bantam, produces likewife the diminutive breed that goes by that name. Paddee birds (boorong peepee), fomething like our sparrows, are in great plenty, and destroy the grain. The dial (moori) has a pretty, but short note; there being no bird on the island which sings. The minor (tecong) has the faculty of imitating human speech, in greater perfection than any other of the feathered tribe: there are both black, and yellow of them. Owls, particularly the great horned one; starling; kingfisher; swallow (lyang); engang, or rhinoceros bird: this is chiefly remarkable for what is called the horn, which reaches half way down the bill, and then turns up: the length of the bill, of one I measured, was ten inches and an half:

half; the breadth, including the horn, fix and an half; length, from beak to tail, four feet; wings, four feet, fix inches; height one foot; length of neck, one foot: the beak is whitish; the horn, yellow and red; the body black; tail white and ringed with black; rump, and feathers on the legs, down to the heel, white: claws, three before and one behind: the iris, red. In a hen chick, there was no appearance of a horn, and the iris was whitish. They eat either boiled rice, or tender flesh meat.

Of reptiles there is some variety. The lizard species are in abun- Reptiles. dance; from the cokay, which is ten or twelve inches long, and makes a very fingular noise, to the smallest house lizard, of which I have seen fome fcarce half an inch in length. They are produced from eggs, about the fize of a wren's. A remarkable circumstance respecting them, which I do not find mentioned in the accounts of any writer, is, that on a flight stroke, and fometimes through fear alone, they lose their tails; which foon begin to grow again. The tail may be separated, with the finallest force, and without any loss of blood, or evident pain to the animal, at any of the vertebræ. The grass lizard is a species between those two. There is, I believe, no class of living creatures, in which the gradations may be traced with fuch minuteness and regularity, as in this. From the fmall house lizard, abovementioned, to the largest aligator or crocodile, a chain may be observed of innumerable links, of which the remotest will have a striking resemblance to each other, and feem, at first view, to differ only in bulk. The house lizard is the largest animal that can walk in an inverted situation; one of these, of fize fufficient to swallow a cockroach, runs on the cicling of a room, and in that posture, feizes it's prey with the utmost facility. This they are enabled to do, from the rugofe make of their feet, with which they adhere strongly to the smoothest surface: sometimes however, on springing too eagerly at a fly, they lofe their hold, and fall to the ground. They are always cold to the touch, and yet the transparency of the bodies of some of them, shew us that their sluids have as brisk a circulation as in other animals: in none that I have feen, is the peristaltic motion so obvious as in these. The female carries two eggs at a time, one in the lower, and one in the upper part of the abdomen, on opposite sides. They are called by the Malays "cheechah," from the noise they make.

The cameleon, and the flying lizard are also found on Sumatra. The former, including the tail, are about a foot and a half long; green, with brown fpots, as I have them preferved. When feen alive in the woods, they are generally green; but not from the reflection of the trees, as fome have supposed; and when caught, they usually turn brown; feemingly the effect of fear; as men become pale. Like others of the genus, they feed on flies, which the large fize of their mouths is well adapted for catching. They have five long toes, armed with fharp claws, on the fore and hind feet. Along the spine, from the head to the middle of the back, little membranes stand up, like the teeth of a faw. The flying lizards are about eight inches long. The membrane which conflitutes the wings, and which does not extend from, and connect with, the fore and hind leg, as in the bat species, is about two or three inches in length. They have flapped ears, and a kind of bag, or alphorges, under the jaws. In other respects they much resemble the cameleon in appearance. They do not take diffant flights but merely from tree to tree, or from one bough to another. The country people take them in springes fastened to the stems.

With frogs and toads the swamps every where abound. These fall a prey to the snakes, which are sound here of all sizes; though the largest I ever happened to see, was no more than twelve feet long. This was killed in a hen-house, where it was devouring the poultry. It is very surprizing, but no less true, that they will swallow animals of three or sour times their own apparent bulk or circumference; having in their jaws or throat, a compressive force, that reduces the prey to a convenient dimension. I have seen a small snake, with the hind legs of a frog sticking out of it's mouth, each of them nearly equal to the smaller parts of it's own body, which in the thickest was not more than a man's

little finger. The stories told, of their swallowing deer and busfaloes, in Ceylon and Java, almost choke my belief, but I really cannot take upon me to pronounce them false. If a snake of three or four inches diameter, can gorge a sowl of six or eight inches, I see not but that a snake of thirty seet in length, and proportionate bulk and strength, might swallow almost any beast; after having smashed the bones, which they are said to do by twining round the animal. I imagine that the bite of very sew of the snakes of Sumatra is mortal, as I have never met with a well authenticated instance of any person suffering from them, though they are very numerous, and frequently found in the houses. The hooded snake is seen in the country, but is not common.

Infects, the island may literally be faid to swarm with. I doubt if Infects. there is any part of the world, where greater variety is to be found; but

this branch of natural knowledge has of late years become fo extremely comprehensive, that I cannot take upon me to say there are many new and undescribed species. It is probable however that there are a few; but in order to afcertain these, it is necessary to have an accurate knowledge of those already classed, which I do not pretend to. I shall only make fome few remarks upon the ant species, the multitudes of which overrun the country, and it's varieties are not less extraordinary than it's numbers. The white ant, or termes, I had intended a description of, with an account of it's destructive effects, but this subject has lately been fo elaborately treated by Mr. Smeathman*, who had an opportunity of observing them in Africa, that I purposely omit it as superfluous. Of the formic, the following distinctions are the most obvious. The great red ant, called by the Malays " crango ." this is about three fourths of an inch long; bites feverely, and ufually leaves it's head, as a bee it's fting, in the wound: it is found mostly on trees and bushes, and forms it's nest, by fastening together, with a glutinous matter, a collection of the leaves of a bough, as they grow. The common red ant, refembling our piffmire. The minute red ant, much smaller than the former. There

* See Philosophical Transactions for the year 1781.

are also, the large black ant, not equal in fize to the crango, but with a head of extraordinary bulk; the common black ant; and the minute black ant. These I say are the most striking discriminations; but the classes are in fact, by many times more numerous, not only in the various gradations of fize, but in a circumstance which I do not recollect to have been attended to by any naturalist; and that is, the difference with which they affect the taste, when put into the mouth; which often happens unintentionally, and gave me the first occasion of noticing this fingular mark of variety. Some are hot and acrid, some bitter, and fome four as verjuice. Perhaps this will be attributed to the different foods they have accidentally devoured; but I never found one which tasted sweet, though I have caught them in the fact of robbing a sugar or honey pot. Each species of ant is a declared enemy of the other, and never suffers a divided empire. Where one party effects a settlement. the other is expelled; and in general they are powerful in proportion to their bulk; except the white ant, which is beaten from the field by others of inferior fize; and for this reason it is a common expedient to ftrew fugar on the floor of a warehouse, in order to allure the formicae to the spot, who do not fail to combat and overcome the ravaging, but unwarlike termetes.

Productions

Productions of the island considered as articles of commerce. Pepper trade. Cultivation of pepper. Campbire. Benjamin. Caffra, &c.

F those productions of Sumatra which are regarded as articles of commerce, the most important and most abundant is pepper. This is the object of the East India company's trade thither, and this alone they keep exclusively in their own hands; their servants, and merchants under their protection, being free to deal in every other commodity the country affords.

Many of the chief inhabitants in different parts of the island, having, Establishment as is elsewhere related, invited the English to form settlements in their respective districts, factories were accordingly established, and a permanency and regularity thus given to the trade, which was very uncertain whilst it depended upon the success of occasional voyages to the coast: disappointments ensuing not only from failure of adequate quantities of pepper to furnish cargoes when required, but also from the caprices and chicanery of the princes or chiefs with whom the disposal of it lay. These inconveniences were obviated when the agents of the company were enabled by their refidence on the spot, to inspect the state of the plantations, fecure the collection of the produce, and make an estimate of the tonnage necessary to transmit it to Europe.

In order to bind the native chiefs to the observance of their original promises and professions, and to establish a plausible claim in opposition to the attempts of rival European powers to interfere in the trade of the country, contracts, attended with much form and folemnity, were entered into with the former; by which they engaged to oblige all their dependants to cultivate pepper, and to fecure to us the exclusive purchase of it; in return for which they were to be protected from their enemies, .bnahi

enemies, supported in the rights of sovereignty, and to be paid a certain allowance, or custom, on the produce of their respective territories.

Cultivation of pepper. Campbire. Benjamin. Caf-The price for many years paid for the pepper, was ten Spanish Dollars, or fifty shillings per babar of five hundred weight. By a late refolution of the Company, with a view to the encouragement of the planters, it has been encreased to fifteen dollars. The customs or duty to the chiefs, varying in different diffricts according to specific agreements, may be reckoned on an average, at one dollar and an half per bahar. This low price at which the natives submit to cultivate pepper for us, and which does not produce annually, to each man, more than eight dollars, according to the old rate of purchase; and the complete monopoly we have obtained of it, from Moco Moco northward, to Flat Point fouthward; as well as the quiet and peaceable demeanor of the people under fuch restrictions, is doubtless in a principal degree owing to the peculiar manner in which this part of the island is cut off from all communication with ffrangers, (who might inspire the people with ideas of profit and of refiftance), by the furfs which rage along the fouthwest coast, and almost block up the rivers. The general want of anchorage too, for fo many leagues to the northward of the Straits of Sunda, has in all ages deterred the Chinese and other eastern merchants, from attempting to establish an intercourse that must have been attended with imminent rifk, to unfkilful navigators. Indeed I understand it to be a tradition among those who border on the sea coasts, that it is not many hundred years fince these parts began to be inhabited, and they all speak of their descent as derived from the more inland country.* Thus it appears that those natural obstructions which we are used to lament as the greatest detriment to our trade, are in fact advantages to which it in a great measure owes its existence. In the northern countries of the

island,

^{*} Beaulieu, who visited Sumatra in 1622, and took much pains to acquire authentic information, says that the southern part of the west coast was then woody and uninhabited; and though this was doubtless not strictly true, yet it shews the ideas entertained on the subject by the Malays, of whom he made his enquiries, and proves how little communication there was with the southern people.

island, where the people are numerous and their ports good, they are found to be independant also, and refuse to cultivate plantations, upon any other terms, than those on which they can dispose of the produce of them to private traders.

The pepper plant being scientifically arranged in our catalogues, and Pepper Plant. accurately described by good writers, it is almost unnecessary for me to fay, that it is a vine, or creeping plant, with a ligneous stalk, and dark green leaves, heart shaped, pointed, not poignant to the taste, and having but little or no fmell. The bloffom is fmall and white, and the fruit hangs in bunches refembling those of the currant tree, but longer and less pliant. It is four or five months in coming to maturity. The berries are at first green, turning to a bright red when ripe and in perfection, and foon fall off, if not gathered in proper time. As the whole clufter does not ripen at once, part of the berries would be loft in waiting for the latter ones: it is therefore necessary to pluck the bunch, as soon as its first berries ripen; and it is even usual to gather them green, when they attain to their full growth. Small baskets slung over the shoulder, and a triangular ladder are used in collecting the fruit; which, when gathered, is spread out upon mats, or smooth spots of clean, hard ground, without the garden. It there foon dries, and lofes its color, becoming black and shrivelled, as we see it in Europe. That which is gathered at a proper age, will shrivel least: if plucked too soon, before the berry has acquired the due degree of hardness, it will in a short time, by removal from place to place, become mere dust. When spread to dry, the berries in a few days begin to loosen from the stalks: it is then rubbed by hand, to clear it from these latter; and when thoroughly dry. it undergoes a kind of winnowing, to render it perfectly clean. As there will still, however, be light pepper among it, the planter being willing to throw away as little as possible, it must again be garbled at the scale, by machines for that purpose. A common trial of its goodness, is by rubbing it hard between both hands: if this produces little or no effect on it, the pepper is found; but if it has been gathered too young, or has been fuffered to lie too long upon the earth, in moist weather,

a great part of it will be reduced to dust. Pepper which has fallen to the ground over-ripe, and been gathered from thence, will be known by being deprived of its outer coat. It is in this state, an inferior kind of white pepper.

Cultivation of pepper.

In the cultivation of pepper, the first circumstance that claims attention, and on which indeed the whole depends, is the choice of proper ground. The experiments hitherto made by Europeans, have not been fufficiently accurate, to determine the particular foil that fuits it best; but it appears to thrive with nearly equal vigour in all the different kinds, between the two extremes; of fand, which prevails through the low country near the fea coast; and of the barren, yellow clay, of which is formed the greater part of the rifing grounds, as they approach the hills. The latter indeed, at greater or lefs depth, constitutes generally the basis even of the best soils; but when covered by a coat of mould, not less then a foot deep, it is sufficiently fertile for every purpose of this cultivation. The level ground, along the banks of rivers, if not fo low as to be flooded by the freshes; or even then, if the water does not remain upon it above a day; affords in general the most eligible spots, both in point of fertility, and the convenience of water carriage for the produce. Declivities, unless very gentle, are to be avoided; as the mould, loofend by culture, is liable in fuch fituations, to be fwept away by the heavy rains. Even plains, when covered by long grass only, will not be found to answer, without the affishance of the plough, and of manure; their long exposure to the fun, exhausting the source of their fertility. How far the produce in general might be encreased by the introduction of these improvements in agriculture, I cannot take upon me to fay, but I fear, that from the natural indolence of the people, and their averfeness from the business of pepper planting, owing in great measure to the small returns it yields them, they will never be prevailed upon to take more pains with it than they now do. The planter, therefore, depending more upon the natural quality of the foil, than on any improvement it may receive from his labor, will find none to fuit his purpose better than that covered with old woods; whose rotting trunks

trunks, and falling leaves, enfure to him a degree of fertility, fuperior to any that is likely to be given to other ground, by a people, with whom agriculture is in its infancy. Such spots are generally chosen by the industrious among them for their laddangs (paddee or rice plantations); and though the labor that attends them is confiderable, and it may be prefumed, that their fertility can scarcely be so soon exhausted, it is very feldom that they feek from the same ground, a second crop of grain. Allured by the certainty of confiderable produce from a virgin foil, and having land, for the most part at will, they renew their labor annually, and defert the plantations of the preceding year. Such deferted plantations, however, are often favorable for pepper gardens; and young woods, of even three or four years growth (balookar), frequently cover ground of this nature, equal to any that is to be met with. Upon the whole, where variety of fituations admits of choice, the preference is to be given, to level grounds; moderately elevated; covered with wood; as near as may be to the banks of rivers or rivulets; and the furface of whose foil is a dark mould of proper depth. This is to be cleared as for a laddang; the underwood being first cut down, and left some days to wither, before the larger trees are felled. When completely dry, and after some continuance of fair weather, the whole is burned; and if effectually done, little remains to render the spot as clear as is requisite.

The garden ground is then marked out, in regular squares of fix feet or five Malay covits, the intended distance of the plants of which there are usually a thousand in each garden. The next business is to plant the chinkareens. These are to serve as props to the pepper vines, (as the Romans planted elms for their grapes), and are cuttings of a tree of that name, put in the ground several months before the pepper, that the shoot may be strong enough to support the plant, when it comes to twine round it. Sometimes the chinkareens are chosen fix feet long, and the vine is then planted the same season, or as soon as the former is supposed to have taken root: but the principal objections to this method are, that in this state, they are very liable to fail, and require renewal, to the prejudice of the garden; that their shoots are not so vigorous as those of

the short cuttings; and that they frequently grow crooked. The circumstances which render the chinkareen particularly proper for this purpose, are, it's easiness and quickness of growth; and the little thorns or spines with which it is armed, enabling the vine more firmly to adhere to it. Some, however, prefer the bitter chinkareen, (with a brownish red flower), though smooth, to the prickly (bearing a white), because the elephant, which often proves destructive to the gardens, avoids the former, on account of its disagreeable taste, though it is not deterred by the spines, from devouring the other species. These, however, are more generally in use.

When the chinkareen has been some months planted, the most promifing, perpendicular shoot, is to be reserved for growth, and the rest to be lopped off; and when it has attained to the height of two, or at most, two sathoms and a half, it is to be headed or topped; no further height being required.

It has been often doubted, whether the growth and produce of the pepper vine, is not confiderably injured by the chinkareen, which must rob it of it's proper nourishment, by exhausting the earth. On this principle, the vine, in other of the eastern islands, and particularly at Borneo Proper, is supported by poles, that do not vegetate, as are hops in England. Yet it is by no means clear to me, that the Sumatran method is fo difadvantageous as it may feem. By reason of the pepper vine lasting many years, whilst the poles, exposed to the sun and rain, and loaded with a confiderable weight, cannot be supposed to last above two feafons; there must be a frequent shifting; which, notwithstanding the utmost care, must tear the plants, and often destroy them. Besides. it may perhaps be the case, that the shelter from the violent rays of the fun, afforded by the branches of the chinkareen, to the plants; and which, during the dry monfoon, is of the utmost consequence; may go near to counterbalance the injury occasioned by their roots: not to infift on the opinion of a celebrated writer; that trees, acting as fyphons, derive from the air, and transmit to the earth, as much of the principle

of vegetation, as are expended in their nourishment. I believe it is not observed, that ground, covered with large trees, or other perennials, is much impoverished by them; which perhaps may only be the case with annuals. Of this however I do not pretend to judge.

The chinkareens are planted one fathom, or one fathom and a quarter, afunder, that they may not impede each other's growth, or keep too much of the air from the vines. The boughs are carefully lopt from the stem, and the top cut in such a manner, as to make it spread in an umbell, for the purpose of more effectually shading the garden. The proper feafon for lopping them, is during the rainy months, or November, December, and January, which, befide the view to their shooting forth again towards the dry feason, prevents the plants from being injured by the dropping from the branches. Great affiduity is required of the planters, to keep the gardens from being overrun with weeds and fhrubs, which would foon choke the plants. These they remove with the prang (bill) and hoe; taking care not to injure the roots of the pepper: yet, in the hot months of June, July, and August, they fuffer the ground to remain covered with lallang (long grafs), as it contributes to mitigate the effects of the violent heat upon the earth, and preserves the dews, that at this time fall copiously, a longer time on the ground; which tends much to encourage the growth of the young vines, and those newly turned down.

The plants of the pepper are most commonly taken from the shoots that run along the earth, from the foot of an old vine; and as these, from almost every knot or joint, strike roots into the ground, and shoot up perpendicularly, a single joint, in this state, is a sufficient plant for propagation. It requires at first some little assistance, to train it to the chinkareen; but it will soon secure it's hold, by the sibres that spread from the joints of it's stem and branches.

Two vines are usually planted to one chinkareen. These are suffered to grow for three years, with only a little occasional attention; by

which time they attain, according as the foil is fertile, the height of eight to twelve feet, and begin to shew their fruit. Then the operation of turning down, is performed; for which, moderate rainy weather is necessary. They are cut off about three feet from the ground, and being loofened from the prop, are bent into the earth, in fuch a manner, that the upper end returns to the roots; the vine lying horizontally, and forming a kind of circle. This, by laying as it were a new foundation, is supposed to give fresh vigor to the plants, and they bear plentifully the enfuing feafon; whereas, if permitted to run up in the natural way, they would exhauft themselves in leaves, and produce but little fruit. The garden should be turned down at the season, when the clusters begin to ripen; and there is faid to be a great nicety in hitting the exact time; for if it be done too foon, the vines fometimes do not bear for three years afterwards, like fresh plants; and on the other hand also, the produce is retarded, when they omit to turn them down till after the fruit is gathered; which, avarice of present, at the expence of future advantage, fometimes inclines them to. It is not very material how many stems the vine may have, in its first growth, but after turning down, two only, (or if very ftrong, one) must be suffered to rise. and cling to the chinkareen: more are fuperfluous, and only weaken the whole. The furplus number may however be advantageously used. by being cut off at the root, on turning down, and transplanted either to the chinkareens, whose vines have failed, or to others, encreasing the garden. With these offsets, whole gardens may be at once planted, and the stem thus removed will bear as soon, or nearly so, as that from which it has been taken. The chinkareen intended to receive them must, of course, be proportionably large. Where the plants or offsets of this kind (called lado angore), can be procured in plenty, from gardens that are turning down, they are sometimes planted of the full fize, two fathoms; by which means, fruit may be obtained, at farthest, by the second season. The luxuriant fide-shoots from the vines, are to be plucked off; as well as those that creep along the ground, unless where they may be required for plants; and if the head of the vine becomes too bufhy, it must be pruned away. Isologoo sittle only a title occasional rol wors of

Besides the method already described, of turning down vines, the planters sometimes practice the following. The original vine, when cut short, is not bent into the earth, but two or three of the best shoots from it are turned down, and let to spring up at some distance; being still brought back, and trained to the same chinkareen. By this means the nourishment is collected from a more extensive circuit of earth. Sometimes the gardens are suffered to grow without turning down at all; but as the produce is supposed to be considerably injured by the neglect, and doubtless with reason, the contrary is enjoined by the strictest orders.

When the vines originally planted to any of the chinkareens, are obferved to fail or miss; instead of replacing them with new plants, they conduct one of the shoots, or succours, from a neighbouring vine, to the spot, through a trench made in the ground, and there suffer it to rise up anew; often at the distance of twelve or sourteen seet from the parent stock.

This practice of turning down the vines, which appears very fingular, and certainly contributes to the duration, as well as strength of the plant, yet probably may amount to nothing more than a substitute for transplantation. The people of Europe observing that plants often fail to thrive, when permitted to grow up in the same beds where they were first set, found it expedient to remove them, at a certain period of their growth, to fresh situations. The Sumatrans observing the same failure, in the sirst case, had recourse to the same alternative; but effected it in a different, and perhaps more advantageous mode. It should be remarked that attempts have been made to propagate the pepper by cuttings, or layers, called charrang, instead of the usual method; which at first seemed to promise great success; but it was found that these did not continue to bear, for an equal number of years; which was a powerful argument for discontinuing the experiment.

The vines, as has been observed, generally begin to bear in three years from the time of planting; but their produce is retarded for one, or perhaps two years, by the process of turning them down. This afterwards continues to encrease, till the seventh or eighth year, when the garden is esteemed in prime; and that state it maintains, according to the goodness of the soil, for one, two or three years, when it gradually declines, till it grows too old to bear. Fruit has been gathered from some at the age of twenty years; but such instances are very uncommon.

A man and woman, if industrious, may with ease look after a garden of a thousand vines; besides raising paddee sufficient for their subsistence: or one hard working man can perform it. In order to lighten the task, a crop of grain is commonly, and may without detriment, be raised from the garden ground in the first season. When cleared, just before they sow the paddee, the short chinkareens are to be planted; and when it is reaped, and the stalks of it cleared away, these are of proper age to receive the vines. By thus uniting the objects of his culture, the planter may have a garden formed, without any other, (for a season) than the usual labor necessary for raising provisions for his family.

The pepper gardens are planted in even rows, running parallel and at right angles with each other. Their appearance is very beautiful, and rendered more striking by the contrast they exhibit to the wild scenes of nature which surround them. In highly cultivated countries, such as England, where landed property is all lined out, and bounded and intersected with walls and hedges, we endeavour to give our gardens and pleasure grounds, the charm of variety and novelty, by imitating the wildnesses of nature in studied irregularities. Winding walks, hanging woods, craggy rocks, falls of water, are all looked upon as improvements; and the stately avenues, the canals, and lawns of our ancestors, which afforded the beauty of contrast, in ruder times, are now exploded. These different tastes are not merely the effect of caprice, nor entirely of refinement, but result from the change of circumstances. A man who should attempt to exhibit on Sumatra, the modern, or irregular style of laying

laying out grounds, would attract but little attention, as the unimproved feenes, adjoining on every fide, would probably eclipse his labors. Could he, on the contrary, raise up, amidst these magnificent wilds, one of the antiquated parterres, with its canals and fountains, whose symmetry he has learned to despise; his work would produce admiration and delight. A pepper garden cultivated in England, would not, in point of external appearance, be considered as an object of extraordinary beauty, and would be particularly found fault with for its uniformity; yet, in Sumatra, I never entered one, after travelling many miles, as is usually the case, through the woods, that I did not find myself affected with a strong sensation of pleasure. Perhaps the simple view of human industry, so scantily presented in that island, might contribute to this pleasure, by awakening those social feelings that nature has inspired us with, and which make our breasts glow on the perception of whatever indicates the happiness of our fellow creatures.

Once in every year, a furvey of all the pepper plantations is taken by the Company's European fervants, refident at the various fettlements, in the neighbourhood of which that article is cultivated. The number of vines in each particular garden is counted; accurate observation is made of its state and condition; orders are given, where necessary, for further care, for completion of stipulated quantity, renewals, changes of fituation for better foil; and rewards and punishments are distributed to the planters, as they appear, from the degree of their industry or remissiness, deserving of either. Memorandums of all these are noted in the furvey-book, which, befide giving prefent information to the chief, and to the governor and council, to whom a copy is transmitted, serves as a guide and check for the furvey of the fucceeding year. An abfract of the form of the book is as follows. It is divided into fundry colums, containing, the name of the village; the names of the planters; the number of chinkareens planted; the number of vines just planted; of young vines, not in a bearing state, three classes or years; of young vines not in a bearing state, three classes; of vines in prime; of those on decline; of those that are old, but still productive;the total number; and lastly the quantity of pepper received durin

during the year. A space is left for occasional remarks, and at the conclusion is subjoined a comparison of the totals of each colum, for the whole district or residency, with those of the preceding year. This business, the reader will perceive to be attended with considerable trouble, exclusive of the actual fatigue of the surveys, which from the nature of the country, must necessarily be performed on foot, in a climate not very favourable to such excursions. The journeys in few places can be performed in less than a month, and often require a much longer time.

The inhabitants, by the original contracts of the head men with the company, are obliged to plant a certain number of vines: each family one thousand, and each young unmarried man, five hundred; and in order to keep up the fuccession of produce; so soon as their gardens attain to their prime state, they are ordered to prepare others, that may begin to bear, as the old ones fall off; but as this can feldom be enforced, till the decline becomes evident, and as young gardens are liable to various accidents, which older ones are exempt from, the fuccession is rendered incomplete, and the confequence is, that the annual produce of each district fluctuates, and is greater or less, in the proportion of the quantity of bearing vines to the whole number. To enter minutely into the detail of this bufiness, will not afford much information or entertainment to the generality of readers, who will however be furprized to hear that pepper planting, though fearcely an art, fo little skill appears to be employed in its cultivation, is nevertheless a very abstruse science. The profoundest investigations of very able heads have been bestowed on this subject, which took their rise from the censures naturally expressed by the Directors at home to the Servants abroad, for a supposed mismanagement, when the investment, as it is termed, of pepper, decreafed in comparison with preceding years, and which the unfavorable. ness of seasons did not by any means account for satisfactorily. To obviate fuch charges, it became necessary for the gentlemen who superintended the bufiness, to pay attention to, and explain the efficient causes which unavoidably occasioned this fluctuation, and to establish general principles

principles of calculation, by which to determine at any time, the probable future produce of the different refidencies. These will depend upon a knowledge of the medium produce of a determinate number of vines, and the medium number to which this produce is to be applied: both of which are to be afcertained only from a comprehensive view of the fubject, and a nice discrimination. Nothing general can be determined from detached inftances. It is not the produce of one particular plantation, in one particular stage of bearing, and in one particular seafon; but the mean produce of all the various classes of bearing vines collectively, drawn from the experience of feveral years, that can alone be depended on in calculations of this nature. So in regard to the medium number of vines prefumed to exist at any residency in a future year, to which the medium produce of a certain number; one thousand for instance: is to be applied, the quantity of young vines of the first, second and third year, must not be indiscriminately advanced, in their whole extent, to the next annual stage, but a judicious allowance, founded on experience must be made, for the accidents to which, in spite of a resident's utmost care, they will be exposed. Some are lost by neglect or death of the owner; fome are deftroyed by inundations, others by elephants and wild buffaloes, and some by unfavorable seasons; and from these several confiderations, the number of vines will ever be found confiderably decreased, by the time they have arrived at a bearing state. Another important object of confideration, in these matters, is the comparative state of a residency at any particular period, with what may be justly confidered as its medium state. There must exist a determinate proportion, between any number of bearing vines, and fuch a number of young as are necessary to replace them when they go off and keep up a regular fuccession. This will depend in general upon the length of time before they reach a bearing state, and during which they afterwards continue in it. If this certain proportion happens at any time to be disturbed, the produce must become irregular. Thus, if at any period, the number of bearing vines shall be found to exceed their just proportion to the total number, the produce, at fuch period, is to be confidered as above the mean, and a subsequent decrease may be with certainty predicted, and pulation in a refidency afcertained, it becomes easy to determine the true medium number of bearing vines in that refidency.

cinca and the medium number to which this produce is to

There are, agreeably to the form of the furvey book, eleven stages or classes of vines, each advanced one year. Of these classes, fix are bearing, and five young. If therefore the gardens were not liable to accidents, but paffed on from column to column undiminished, the true proportion of the bearing vines to the young, would be as fix to five, or to the total, as fix to eleven. But the various contingencies above hinted at, must tend to reduce this proportion; while on the other hand, if any of the gardens should continue longer than is necessary to pass through all the stages on the survey book, or should remain more than one year in a prime state, these circumstances would tend to encrease the proportion. What then is the true medium proportion, can only be determined from experience, and by comparing the state of a residency at various fuccessive periods. In order to ascertain this point, a very ingenious gentleman, and able fervant of the East India Company *; to whom I am indebted for the most part of what I have laid before the reader on this subject; drew out, in the year 1777, a general comparative view of Manna refidency, from the furveys of twelve years, annexing the produce of each year. From the statement it appeared, that the proportion of the bearing vines to the whole number, in that district, was no more than 5,1 to 11, instead of 6 to 11, which would be the proportion if not reduced by accidents: and further, that when the whole produce of the twelve years was diffused over the whole number of bearing vines during that period, the produce of one thousand vines came out to be four hundred and fifty three pounds, which must therefore be estimated as the medium produce of that residency. The fame principle of calculation being applied to the other refidencies, it appeared, that the mean annual produce of one thousand vines, in all the various stages of bearing, taken collectively throughout the country, deduced from the experience of twelve years, was four hundred and

four pounds. It likewise became evident from the statements drawn out by that gentleman, that the medium annual produce of the company's fettlements on the west coast of Sumatra, ought to be estimated at twelve hundred tons, of fixteen hundred weight; which is corroborated by an average of the actual receipts for any confiderable number of years.

Thus much will be fufficient to give the reader an idea of pepper planting, as a science. How far, in a commercial light, this produce answers the Company's views in supporting the settlements, is foreign from my purpose to discuss, though it is a subject on which not a little might be faid. It is the history of the island, and it's inhabitants, and not of the European interests, that I attempt to lay before the public.

The natives distinguish three species of pepper, which are called at different places by different names. At Laye, in the Rajang country. they term them lado Cawoor, lado Manna, and lado Jambee, from the parts where each fort is supposed to prevail, or from whence it was first brought to them. The lado Cawoor, or Lampoon pepper, is the strongest plant, and bears the largest leaf and fruit; is slower in coming to perfection than the fecond, but of much longer duration. The leaf and fruit of lado Manna are somewhat smaller, and its peculiarity, that it bears foon and in large quantities, but feldom paffes the third or fourth years crop. The Jambee, which has defervedly fallen into great difrepute, is of the smallest leaf and fruit, very short lived, and not without difficulty trained to the chinkareen. In some places to the southward they distinguish two kinds only, lado Soodool and lado Jambee. Lado sooloor and lado angore are not distinctions of species; the former denoting the young shoots of pepper commonly planted, in opposition to the latter, which is the term for planting by flips.

White pepper is manufactured by stripping the outer husk or coat from White Peppers the ripe and perfect grains. This was for centuries supposed in Europe to have been the produce of a different plant, and to poffess quadities superior to the common fort; on the strength of which idea, it used

to fell for some time, at the India sales, for treble the price of the black. But it loft this advantage as foon as it came to be known, that the fecret depended merely on the art of blanching the common pepper. For this purpose it is steeped for a certain time; about a fortnight; in water, in pits dug for the occasion in the banks of rivers, and sometimes in swamps and flagnant pools; till by fwelling it burfts its tegument, from which it is afterwards carefully seperated by drying it in the fun and rubbing it between the hands. It has been much disputed, and is still undetermined, to which fort the preference ought to be given. The white pepper has this fuperiority, that it can be made of no other than the best and foundest grains, taken at the properest state of maturity: but on the other hand it is argued, that by being fuffered to fleep the necessary time in water, its ftrength is confiderably diminished, and that the outer husk which is loft by the process, has a peculiar flavor distinct from that of the heart, and though not fo poignant, more aromatic. The white pepper stands the Company in about three times the price of the black; owing to the encouragement they were obliged to give the planters to induce them to deviate from their accustomed tract; but having been fold a few years ago at an equal, and I believe one feafon at an inferior rate. orders were fent out for restraining the manufacture to a very small . quantity.

The feason of the pepper vines bearing, as well as that of most other fruits on Sumatra, is subject to great irregularities, owing perhaps to the uncertainty of the monsoons, which are not there so strictly periodical, as on the other side of India. Generally speaking, however, the pepper produces two crops in the year; one called the greater crop, (poopool augoong) about the month of September, the other called the lesser or half crop (booa lello) about the month of March. Sometimes in particular districts, they will be employed in gathering it in small quantities, during the whole year round; blossoms and ripe fruit appearing together on the same vine; whilst perhaps in others, the produce is that year consined to one crop. In Laye residency, the principal harvest of pepper, in the year 1766, was gathered between the months of February and May, in

1767 and 1768, about September and October; in 1772, between June and August, and for the four succeeding years was seldom received earlier than November and December. Long continued droughts, which sometimes happen, stop the vegetation of the vines, and retard the produce. This was particularly experienced in the year 1775, when for a period of about eight months, scarcely a shower of rain fell to moisten the earth. The vines were deprived of their foliage; many gardens perished, and a general destruction was expected. But this apparent calamity was attended with a confequence not forefeen, though analogous to the usual operations of nature in that climate. The natives, when they would force a tree that is backward, to produce fruit, strip it of it's leaves, by which means the nutritive juices are referved for that more important use, and the blossoms soon begin to shew themselves in abundance. A fimilar effect was displayed in the pepper gardens, by the inclemency of the feafon. The vines, as foon as the rains began to descend, threw out blossoms in a profusion unknown before; old gardens which had been unprolific for two or three years began to bear; and accordingly the crop of 1776,7 confiderably furpaffed that of many proceeding years.

The pepper is mostly brought down from the country on rasts (rackee) which are sometimes composed of rough timbers, but usually of large bamboos; with a platform of the same, split, to keep the cargo dry. They are steered at both head and stern, in the more rapid rivers, with a kind of rudder, or skull rather, having a broad blade, sixed in a fork or crutch. Those who steer are obliged to exert the whole strength of the body, in those places especially where the fall of the water is steep, and the course winding. But the purchase of the skull is of so great power, that they can move the rast bodily across the river, when both ends are acted upon at the same time. But notwithstanding their great dexterity, and their judgment in chusing the channel, they are liable to meet with obstruction in large trees and rocks, which, from the violence of the stream, overset, and sometimes dash their rast to pieces.

It is a generally received opinion, that pepper does not fustain any damage by an immersion in sea water; a circumstance that attends perhaps a fourth part of the whole quantity shipped from the coast. The furf, through which it is carried in an open boat, called a fampan lonchore, renders fuch accidents unavoidable. This boat which carries one or two tons, being hauled up on the beach, and there loaded, is shoved off, with a few people in her, by a number collected for that purpose, who watch the opportunity of a lull, or temporary intermission of the fwell. A tombongon, or country veffel, built to contain from ten to twenty tons, lies at anchor without, to receive the cargoes from the fampans. At many places, where the qualloes, or mouths of the rivers, are tolerably practicable, the pepper is fent out at once in the tombongons, over the bar; but this; owing to the common shallowness of the water, and violence of the furfs; is attended with confiderable rifk. Thus the pepper is conveyed, either to the warehouses at the Presidency. or to the Europe ship lying there to receive it.

-Camphire.

Among the other commodities of the island, a conspicuous place belongs to the camphire.

This, distinguished among us, by the epithet of native camphire, and called by the Malays, Capoor Barroos, is a production for which Sumatra, as well as Borneo, has in all ages been much celebrated; the Arabians being, at a very early period, acquainted with its virtues. Chymists have entertained opinions extremely discordant, in regard both to the nature and properties of camphire; and even at this day it seems to be but imperfectly known. I shall not attempt to decide whether it be a resin or not; though the circumstance of its being soluble in spirits and not in water, would seem to entitle it to that class; nor shall I pretend to determine whether its qualities, as a medicine, are hot or cold. My province is to mention such particulars of its history as have come within the scope of my own observation, leaving to others to speculate upon it's uses.

The champhire tree is a native of the northern parts of the island only, growing, without cultivation, in the woods which lie near to the sea coast, and is equal in height and bulk to the largest timber trees, being frequently sound upwards of sisteen feet in circumference. The leaf is small, of a roundish oval, ending in a long point or tail; the sibres running all parrallel and nearly streight. The wood is in much esteem for carpenter's purposes, being easy to work, light, durable, and not liable to be injured by insects, particularly by the coembang, a species of bee which from its faculty of boring timber, for its nest, is called in common, the carpenter.

The camphire being of a dry nature does not exfude from the tree, or manifest any appearance on the outside. The natives, from long experience, know whether any is contained within, by striking it with a stick. In that case they cut it down and split it with wedges into small pieces, finding the camphire in the interstices, in the state of a concrete crystilazation. Some have afferted that it is from the old trees alone that this substance is procured, and that in the young trees it is in a study state, called meenia capoor, or camphire oil; but this, I have good authority to pronounce a mistake. The same kind of tree that produces the sluid, does not produce the dry, transparent, and sleaky substance, nor ever would. They are readily distinguished by the natives. Many of the trees, however, produce neither the one nor the other.

The native camphire is purchased on the spot, at the rate of six Spanish dollars the pound, or eight dollars the catty, for the best fort; which sells at the China market, for about twelve or sisteen hundred dollars the pecul of an hundred catties, or one hundred, thirty three pounds and a third. The traders distinguish usually, three different degrees of quality in it, by the names of head, belly and foot, according to its purity and whiteness, which depend upon its being more or less free from particles of the wood, and other heterogeneous matter, that mix with it in collecting, after the first large pieces are picked out. Some add a fourth fort, of extraordinary fineness, of which a few pounds only

are imported to Canton, in the year, and fell there at the rate of two thousand dollars the pecul*.

The Chinese prepare, as is generally supposed, a factitious substance refembling this native camphire, and impregnated with its virtues, by the admixture of a small quantity of the genuine; which they sell to the Dutch for thirty or forty dollars the pecul, who afterwards refine it to the state in which we see it in our shops, where it is fold for eight shillings the pound weight. This appears an extraordinary circumstance, that any article could possibly be so adulterated; and at the same time bear the likeness, and retain the qualities of its original; as that the dealers should be able, with profit to themselves, to fell it again for the fiftieth part of the price they gave. But upon enquiry from an ingenious gentleman long refident in China, I learned that the Chinese, or more properly, the Japan camphire, is not a factitious substance, but the pure produce of a tree which grows in abundance in the latter country, different entirely from that of Sumatra, and well known to our botanists by the name of Laurus Campbora*: that they never mix the native fort (as we term it) with the Japan, but purchase the former for their own use, at the above extravagant price, from an idea, superstitious probably, of its efficacy, and export the latter, as a drug they hold in no estimation. Thus, we buy the leaves of their tea plant, at a high rate, and neglect herbs, the produce of our own foil, poffesting at least equal virtues. It is known, that the camphire termed factitious, will evaporate till it wholly disappears, and at all periods of its diminution, retain its full strength, which do not feem the properties of an adulterated or compounded body. Kemfer fays that it is prepared from a decoction of the wood and roots of the tree, cut into small pieces. The native fort,

^{*} See Price Currents of the China Market. Camphire was purchased on Sumatra by Beaulieu, in 1622, at the rate of fifteen Spanish dollars for twenty eight ounces, which differs but little from the modern price.

^{*} Specimens of the Leaves of the Japan Camphire tree, and those of the Sumatran or Bornean Camphire, may be seen in a plate in Valentini Historia Simplicium. Page 488. Tab. 7.

though doubtless from its volatility it must be subject to some decrease, does not appear to lose much in quantity from being kept, as I have particular experience of. What I had of the Chinese fort is long since evaporated. I know not what superiority in the material medica, is allowed to the capoor barroes, in point of esticacy: it is possibly considerable, though certainly not in the proportion of sifty to one. Perhaps it may not have had a fair trial, being rarely brought to Europe but as a curiosity.

The camphire oil before mentioned, is a valuable domestic medicine, and much used by the Sumatrans, in strains, swellings, and inflammations, the particles, from their extreme fubtilty, readily entering the pores. It is not manufactured, undergoes no preparation, and though termed an oil, is rather a liquid and volatile refin, distilling from one species of the camphire tree, without any oleaginous quality. To procure it, they proceed in the following manner. They make a transverse incision into the tree, to the depth of some inches, and then cut sloping downwards from above the notch, till they leave a flat, horizontal superficies. This they hollow out, till it is of a capacity to receive about a quart. They then put into the hollow, a bit of lighted reed, and let it remain for about ten minutes, which acting as a ftimulus, draws the fluid to that part. In the space of a night, the liquor fills the receptacle prepared for it, and the tree continues to yield a leffer quantity, for three fuccessive nights, when fire must be again applied; but on a few repetitions it is exhausted. An oil not much unlike that from the camphire, is procured from another tree, by the fame method. It is called meenia cayoo or wood oil, and is used to rub on timber exposed to the weather, to preserve it from decay; and it is also boiled with the dammar to pay the bottoms of ships and boats.

Benjamin,

Benjamin or benzoin (caminyan), called a gum, though from it's fohubility in spirits it would seem more properly a resin, is produced from a tree which grows in great abundance in the northern parts of the island, particularly in the Batta country, and met with, though rarely

rarely, to the fouthward of the line, where, from natural inferiority, or want of skill in collecting it, the small quantity produced is black and of little value. The tree does not grow to any confiderable fize, and is never used as timber. The seeds are round, of a brown color, and about the fize of a moderate bolus. The leaves are rough, crifp, inclining to curl at the point, and yield a very strong scent, resembling that of turpentine, more than of their proper gum. In some places, near the sea coaft, the natives cultivate large plantations of it, as the quickness of it's growth affords them a probability of reaping the advantage of their industry, which they could scarcely expect from the camphire tree, and I believe that none of them are fo provident as to look forward to the benefit of posterity. The seeds or nuts are sown in the paddee fields, and afterwards require no other cultivation than to clear away the shrubs from about them. When the trees are grown fo big, as to have trunks of fix or eight inches in diameter, incifions are then made in the bark, from whence afterwards the gum exfudes, which is carefully pared off with a knife. The pureft of the gum, coming first from the tree, is white, foft and fragrant, and is called head benjamin, according to the usual distinction of the qualities of drugs in India. The inferior forts. which, in the operation, are more or less mixed with the parings, and perhaps other juices of the tree, are darker colored, and harder: particularly the foot, which is very foul. The trees will feldom bear a repetion of those incisions more than ten or twelve years. The head is subdivided into Europe and India head, of which the first is superior, and is the only fort adapted to that market: the other, with most of the belly, goes to Arabia, the Gulph of Persia, and some places in India, where it is burned, as in the Malay islands, to perfume the houses, expell troublesome insects, and obviate the pernicious effects of unwholesome air, or noxious exhalations. It is brought down from the country in tompanys or large cakes, covered with matting. In order to pack it in chefts, it is necessary to foften with boiling water. the coarfer forts; the head benjamin is broken into pieces, and exposed to the heat of the fun, which proves fufficient to run it down. The greatest part of the quantity brought to England, is exported from sonath particularly in the Betta country, an

thence again to the Roman catholic countries, where it is burnt as incense in their religious rites. The remainder is chiefly employed in medicine, being much esteemed as an expectorant and styptic, and constitutes the basis of that valuable balfam, distinguished by the name of Turlington, whose very falutary effects, particularly in the cure of green and other wounds, is well known to gentlemen abroad, who cannot always obtain affiftance from the faculty, and to which I can bear myfelf, the amplest testimony. It is also employed, if I am not misinformed, in the composition of court sticking plaister. There is reason to regret that its virtues have not been more carefully explored, as there is the ftrongest prefumption of its possessing as powerful and salubrious qualities, as any vegetable production in the materia medica. I have not a doubt but that fome physician of genius, assisted by the skill of an able chymist, will one day bring this article, as well as camphire, which has been too much, though not equally neglected, into the repute they feem fo eminently to deserve. There are two other species of Benjamin; the one diffinguished by the epithet of scented (doolang) from its peculiar fragrance; and the other, a wild fort (roxemalla) of little value, and not confidered as an object of commerce.

Cassia (cooleet manees). This is a coarse species of cinnamon, well Cassia. known in Europe, which flourishes chiefly as well as the two foregoing articles, in the northern part of the island; but with this difference, that the camphire and benjamin grow only near the coast, whereas the cassia is a native of the central parts of the country. It is mostly procured in those districts which lie inland of Tappanooly, but is also found in Moofee, where Palembang river takes its rife. The leaves are about four inches long, narrower than the bay, (to which tribe it belongs) and more pointed; deep green; smooth surface, and plain edge. The principal fibres take their rife from the peduncle. The young leaves are mostly of reddish hue. The blossoms grow fix in number upon slender footstalks, close to the bottom of the leaf. They are monopetalous, small, white, stellated in fix points. The stamina are fix, with one style, growing from the germen, which stands up in three brownish fegments, re-X X n encouragement, be procured in fembling

sembling a cup. The trees grow from fifty to fixty feet high, with large, fpreading, horizontal branches, almost as low as the earth. The root is faid to contain much camphire, that may be obtained by boiling or other processes unknown on Sumatra. No pains is bestowed on the cultivation of the cassia. The bark, which is the part in use, is commonly taken from fuch of the trees as are a foot or eighteen inches diameter, for when they are younger, it is faid to be fo thin, as to loofe all it's qualities very foon. The difference of foil and fituation alters confiderably the value of the bark. Those trees which grow in a high rocky foil, have red shoots, and the bark is superior to that which is produced in a moist clay, where the shoots are green. I have been assured by a person of extensive knowledge, that the cassia produced on Sumatra, is from the same tree which yields the true cinnamon, and that the apparent difference arises from the less judicious manner of quilling it. younger and more tender branches should be preferred; perhaps the age of the tree, or the feafon of the year ought to be more nicely attended to; and lastly I have known it to be suggested, that the mucilaginous flime which adheres to the infide of the fresh peeled rind, does, when not carefully wiped off, injure the flavor of the caffia, and render it inferior to that of the cinnamon. I am informed that it has been purchased by Dutch merchants at our India fales, where it fometimes fold to much lofs, and afterwards by them shipped for Spain, as cinnamon, being packed in boxes which had come from Ceylon with that article.

Rattans.

Rattans (rotan) furnish annually many large cargoes, chiefly from the eastern side of the island, where the Dutch buy them to send to Europe; and the country traders, for the western parts of India. Canes also, of various kinds, are procured in the ports which open to the straits of Malacca.

Cotton.

In almost every part of the country two species of cotton are cultivated, namely, the annual fort (gosspium berbaceum), and the shrub cotton (gosspium ar ore m). The cotton procured from both appears to be of very good quality, and might, with encouragement, be procured in

any quantities; but the natives raise no more than is necessary for their own domestic manufactures. The filk cotton (bombax ceiba) is also to be met with in every village. This is, to appearance, one of the most beautiful raw materials the hand of nature has presented. It's fineness, gloss, and delicate foftness, render it, to the fight and touch, much fuperior to the labor of the filkworm; but owing to the shortness and brittleness of the staple, it is esteemed unfit for the reel and loom, and is only applied to the unworthy purpose of stuffing pillows and mattrasses. Possibly it has not undergone a fair trial in the hands of our ingenious artists, and we may yet see it converted into a valuable manufacture. It grows in pods, from four to fix inches long, which burft open when ripe. The feeds entirely refemble the black pepper, but are without tafte. The tree is remarkable, from the branches growing out perfectly ftreight and horizontal, and being always three, forming equal angles, at the same height: the diminutive shoots likewise grow flat; and the feveral gradations of branches observe the same regularity to the top. Some travellers have called it the umbrella tree, but the piece of furniture called a dumb waiter, exhibits a more striking picture of it.

The penang or betel nut, before mentioned, is a confiderable article Betel Nut. of traffick to the coast of Coromandel or Telinga, particularly from

The coffee trees are univerfally planted, but the fruit produced here coffee. is not excellent in quality, which is probably owing entirely to the want of skill in the management of them. The plants are disposed too close to each other, and are so much overshaded by other trees, that the sun cannot penetrate to the fruit; owing to which the juices are not well ripened, and the berries, which become large, do not acquire a proper flavor. Add to this, that the berries are gathered whilst red, which is before they have arrived at a due degree of maturity, and which the Arabs always permit them to attain to, esteeming it essential to the goodness of the coffee. As the tree is of the same species with that cultivated in Arabia, there is little doubt but with proper care, this article

might

might be produced of a quality equal, perhaps superior, to that imported from the West Indies; though probably the heavy rains on Sumatra, may prevent it's attaining to the perfection of the coffee of Mocha*.

Turpentine,

glofs, and delicate foreness, render it, to the fight and touch, much fig-The dammer is a species of turpentine, and used for the same purposes to which that and pitch are applied. It is exported in large quantities to Bengal and elfewhere, It exfudes, or flows rather, spontaneously, from the tree in fuch plenty, that there is no need of making incifions to procure it. The natives gather it in lumps from the ground, where it has fallen, or collect it from the shores of bays and rivers, whither it has floated. It hangs from the bough of the tree which produces it, in large pieces, and hardening in the air it becomes brittle, and is blown off by the first high wind. When a quantity of it has fallen in the same place, it appears like a rock, and thence, they fay, it is called dammar battoo; by which name it is diffinguished from the dammar cruyen. This is another species of turpentine, yielded by a tree growing in Lampoon called crityen, the wood of which is white and porous. It differs from the common fort, or dammar battoo, in being foft and whitish, having the confistence, and somewhat the appearance of putty. It is in much estimation for paying the bottoms of veffels, for which use, it ought to be mixed with fome of the hard kind, to give it firmness and duration, of which it corrects the brittleness. The natives, in common, do not boil it, but rub or fmear it on with their hands; a practice which is probably derived from indolence. To procure it, an incision is made in the tree.

Gum.

There is a gum produced abundantly from a tree called *Paty*, which much refembles gum arabic, and as they belong to the fame genus of plants it is not improbable, that this might answer equally well, for

^{*} This observation on the growth of the coffee, as well as many others on the vegetable production of the island, I am indebted for to the letters of Mr. Charles Miller, entered on the Company's records at Bencoolen.

every purpose the other is applied to. There is likewise a gum which I have feen in fmall quantities, brought from the country, called ampallou, which I believe to be gum lacca, refembling it in hardness and

The forests contain a great variety of valuable species of wood, which Variety of though not in general confidered by the natives as objects of trade, are employed as fuch in other countries and might perhaps in this, be turned to account, if properly attended to. Ebony trees (jooar) are in the Ebony. greatest plenty. Sasafras (cayoo gaddees), or a tree possessing its flavor, qualities and virtues; but liker to the elm, than the fir, which that of South America is faid to refemble; grows in great abundance, and is used in medicine, as a sweetener of the blood. The spruce pines which Pine. Captain Cook mentions to have met with in different islands of the South Sea, particularly at that which he named the ifle of Pines, appear from the description and the plate, to be exactly the same with the arou of Sumatra, which we have been used to call the bastard pine, without reflecting on the probability of its yielding the spruce. I have before remarked of this tree, that it delights in a low, fandy foil, and is ever the first that grows on land relinquished by the sea: by what means propagated, I know not, unless the cones float on the water, and are driven on the beach by the tide. On the west coast of Sumatra, there are no areu trees to be met with to the fouthward of Allass, except near Siggin bay, where the river is called Wye arou. Sandal wood (chendana), also the celebrated eagle or aloes wood (garoo), are the produce of this island, and have been much boasted of by the early writers; but I fuspect that they have, fince those days, lost much of their reputation. as well as the different kinds of bezoars, procured from the bodies of various animals, which are now suffered to live unmolested. For shipbuilding there is much excellent timber, and fome which is found by experience to refift the worm, but the shallowness of the rivers and dangerous furfs, will ever prevent its being made use of for that important purpose. Teak (jattee), the pride of the eastern forests, though Teak, growing in abundance to the north and fouth of the island, at Pegu and

Eagle or Aloes.

Java, is there fearce to be met with, except where it has been recently planted*. This wood is in many respects preferable to oak, working

carved work.

more kindly, and equal, at least, in point of duration; many ships built of it at Bombay, continuing to swim for so many years, that none can recollect the period at which they were launched. Its appearance is stately; the leaves are broad and large, and yield when pressed a red juice. The rangee or manchineel, well known in the West Indies, is found here, and proves useful from its quality of resisting the destructive ravages of the termes or white ant. The iron wood (cayoo tray) is from its extraordinary hardness, applicable to many useful purposes. Maranti maracouly and murbow, are in much estimation for building. Cameoning: the appearance of this tree is very beautiful, resembling in its leaves the larger myrtle, with a white slower. The wood, which is light colored, close, and finely veined, takes an exquisite polish, and is used

for the fleaths of creefes. There is also a red grained species inferior to this. Langsanni has also a beautiful grain and is used for cabinet and

Machineel.

Iron-wood.

The foregoing is but a very imperfect view of the treasures of forests, that seem to possess an inexhaustable fund of variety, but of which it must be owned, that the greater number of the species of wood, from their porous nature, and proneness to decay, are of very little value, and scarcely admit of seasoning, ere they are rotten. Before I quit the subject I cannot avoid mentioning a tree, which though of no use, and not peculiar to the island, deserves, for its extreme singularity, that it should not be passed over in silence. I mean that which is, by the English in the West of India, termed the banyan tree; by the Portugueze, arbor de raiis, and by the Malays called jawee jawee. It possesses the uncommon property of dropping roots or sibres from certain parts of its

Banyan-tree.

^{*} Mr. John Marsden, when resident of Laye, in the year 1776, sowed some seeds of the Teak tree and distributed a quantity amongst the inhabitants of his district. The former at least, throve exceedingly, as if in their natural soil. Mr. Robert Hay had a plantation of them near Bencoolen, but the situation seemed unsavorable. At Pegu it is said to be called tecam, from whence the name of teak.

boughs, which, when they touch the earth, become new stems, and go on encreasing to fuch an extent, that some have measured in circumference of the branches, upwards of a thousand feet, and have been said to afford shelter to a troop of horse*. These fibres, that look like ropes attached to the branches, when they meet with any obstruction in their descent, conform themselves to the shape of the resisting body, and thus occasion many curious metamorphoses. I recollect seeing them stand in the perfect shape of a gate, long after the original posts, and cross piece, had decayed and disappeared; and I have been told of their lining the internal circumference of a large brick well; like the worm in a distiller's tub; there exhibiting the view of a tree turned inside out, the branches pointing to the center, instead of growing from it. It is not more extraordinary in its manner of growth, than whimfical and fantastic in its choice of situations. From the side of a wall or the top of a house, it seems to spring spontaneous. Even from the smooth periphery of a wooden pillar, turned and painted, I have feen it shoot forth as if the vegetative juices of the feafoned timber, had renewed their circulation, and begun to produce leaves afresh. I have feen it flourish in the center of a hollow tree, of a very different species, which however still retained its verdure, its branches encompassing those of the jawee jawee, whilst its decayed trunk enclosed the stem, which was visible, at interffices, from nearly the level of the plain on which they grew. This, in truth, appeared fo firiking a curiofity, that I have often repaired to the spot, to contemplate the singularity of it. How the seed, from which it is produced, happens to occupy stations seemingly so unnatural, is not eafily determined. Some have imagined the berries carried thither by the wind, and others, with more appearance of truth, by the birds; which, cleanfing their bills where they light, or attempt to light, leave, in those places, the seeds, adhering by the viscous mat-

^{*} The following is an account of the dimensions of a remarkable Banyan tree, near Manjee, twenty miles west of Patna in Bengal. Diameter 363 to 375 feet. Circumference of the shadow at noon, 1116 feet. Circumference of the several stems, in number sifty or sixty, 921 feet. Under this tree sat a naked Fakir, who had occupied that situation for twenty sive years; but he did not continue there the whole year through, for his vow obliged him to lie, during the sour cold months, up to his neck in the waters of the river Ganges.

ter which furrounds them. However this be, the jawee jawee, without earth or water, deriving from the genial atmosphere it's principle of nourishment, proves in it's encreasing growth, highly destructive to the building that harbours it. The fibrous roots, which at first are extremely fine, penetrate most, common cements, and overcoming, as their fize enlarges, the powerfullest refistance, split, with the force of the mechanic wedge, the most substantial brickwork. When the consistence is fuch as not to admit the infinuation of the fibres, the root extends itself along the outfide, and to an extraordinary length, bearing, not unfrequently, to the stem, the proportion of eight to one, when young. I have measured the former fixty inches, when the latter, to the extremity of the leaf, which took up a third part, was no more than eight inches. I have also seen it wave it's boughs at the height of two hundred feet, of which the roots, if we may term them fuch, occupied at least one hundred; forming, by their close combination, the appearance of a venerable gothic pillar. It stood near the plains of Crocup, but like other monuments of antiquity, it had it's period of existence, and is now no rica, and begun to produce leaves afresh. I have from it flourish

retained its verdure, its branches encompassing those of the jewer is its decayed trunk enclosed the fier which was visible; as interflices, from nearly the level of the plain on which they graw. This, in truth, appeared to striking a curiosity, that I have clean repaired to the spot, to contemplate the singularity of it. How the feed from which it is produced, happens to occupy stations seemingly so unbatural, is not casily determined. Some have imagined the bentles car-

ried thither by the wind, and others, with more appearence of trues, by the birds; which, cleaning their bills where they light, or art mut.

Gold, Tin, and other Metals-Bees-wax-Ivory-Birds-nest-Import Trade.

BESIDE those articles of trade afforded by the vegetable kingdom, Gold. Sumatra, produces many others, and among the chief of these is Gold. This valuable metal is found mostly in the central parts of the island; none, except very rarely, being observed to the fouthward of Leemoon, a branch of Jambee river, or to the northward of Nalaboo, from whence Acheen is principally supplied. Menang cabow has always been esteemed the richeft feat of it; which probably induced the Dutch to establish their head factory at Padang, in it's neighbourhood. The Malays are fettled in, or about, all the diffricts where gold is collected, and as far as my knowledge and enquiries have extended, they appear to be; particularly at Leemoon, Batang affy, and Pacallang Jamboo, where colonies of them are established; the only persons who dig for and collect it; the original inhabitants, whom they distinguish by the name of crang doosoon, or villagers, confining their attention to the raifing of provisions, with which they fupply the Malays who fearch for the metal.

the greater proportion of what they procure, being for that purpose well washed and sifted, till the pure grains are seperated and cleansed from the particles of mud and stone. They occasionally loosen the earth of the adjacent banks, and often divert the course of rivulets, which high

The earth taken up from the beds of the rivers, fupplies them with

up the country are little torrents, through ground newly opened for that purpose. In some parts they dig into the earth in pursuit of the gold, which however can scarcely deserve the appellation of mining, as they do not venture at any confiderable excavation. Some of their pits are

described as being of great depth, but this is probably exaggeration, for their ignorance of the use of windlasses and other machines, must neces-

farily keep them near the furface. The gold being found in a complete Mm metallic

Manner of procuring it.

metallic state, does not undergo any process of refining, purifying, or separating, except from the white rock or marble it sometimes adheres to. They simply beat and wash it, and sell it in the lumps or dust in which they find it. Some of the former have been known to weigh as heavy as six or seven ounces, without mixture; but they are often joined with an equal bulk of marble, and these pieces being admired by the Europeans, sell for the same price, by weight, as if they were all pure gold. In most of the specimens of this fort which I have seen, the gold might more properly be said to enclose the rock, than the latter to contain the gold.

It does not pass through any third hand, before it reaches the Europeans. Of those who dig for it, the most intelligent (distinguished by the name of foudaggar, or trader) are trusted by the rest, with what they collect, who carry it to fambee, Palembang or the West coast, and bartar it for opium and the fine goods of Bengal and Madrass, with which they return, loaded, to their country. From Palembang and Jambee, they have the convenience of water carriage for a considerable part of the way, but it is tedious, being against the stream. From other places they carry their returns on their backs, to the weight, commonly of eighty pounds, through woods, over rivers, and across mountains. They generally travel in parties of one hundred or more, and have frequent occasion to defend their property against the spirit of plunder and extortion, which prevails among the poorer nations, whose districts they are obliged to pass.

Price.

When brought to our fettlements, it is purchased at the high rate of three pounds, five shillings sterling the ounce; so that on exportation to Europe, it scarcely affords a profit even to the original buyer; and others who employ it as a remittance incur a loss, after the India Company's duties, and other incidental charges are deducted*. It has often been thought surprizing, that the Europeans settled on the island, have

^{*} Beaulieu, in 1622, fays that gold was purchased at Acheen for the price it bore in France; but in some parts of the island thirty five per cent. cheaper.

not found it worth their pains, to work, in a proper manner, the mines with which the country does certainly abound; but calculation and experience appear to have taught them, that it is not a scheme likely to be attended with fuccess, owing, among other causes, to the dearness of labor, and the necessity of keeping up a force in distant parts of the country, for the protection of the miners. Europeans cannot possibly work in this climate, and the natives are unfit for the laborious exertion it would require, to render the undertaking profitable. The Dutch have at different periods made attempts of this nature. They fent out, many years fince, a Saxon mineralogist to work a mine at Silleda, but no profit accrued from it; and in latter times they fet about working a vein that ran close to their settlement of Padang, but not finding returns adequate to the expence, their Company ordered it to be let to farm, when in a few years, it fell into fuch low repute, as to be at length disposed of at a rent of two Spanish dollars, by public auction *. The whole quantity of gold procured at the ports on the West-coast, may be estimated at about ten thousand ounces annually, of which Padang alone has been used to draw to it (before its late capture by the English) at least one third part . What quantity finds its way to Palembang and other places on the eaftern fide of the ifland, it is not in my power to compute, but I think it cannot be less than the former.

Value of

- * The English Company having intelligence of a mine discovered near Fort Marlborough, ordered it to be worked; but it never came to any thing.
- † The following is an extract of a letter from Mr. James Moore, a fervant of the Company, dated from Padang, in 1778. "They have lately opened a vein of gold in the country inland of Padang; from which the Governor at one time received an hundred and fifty tial (about two hundred ounces). He has procured a map to be made of a particular part of the gold country, which points out the different places where they work for it: and also the fituation of twenty one Malay forts, that are all inhabited and in repair. These districts are extremely populous, compared to the more southern part of the island. They collect, and export annually to Batavia, about two thousand sive hundred tials of gold from this place: the quantity never exceeds three thousand tials, nor falls short of two."

I am affured that the quantity of gold procured at Padang used to be much greater, but that through the maladministration of a former governor, of the name of Palm, the country was thrown into confusion, and the traders induced to form connexions on the eastern side of the island, whither a large proportion of the gold has since been annually diverted.

Inferior gold.

Gold of a very inferior touch, called mas moodo, or young gold, is found in the same countries where the other is produced, and sells for about twenty five or thirty per cent less value. From its paleness, it would feem to contain a mixture of filver, but the grains refift the force of aqua fortis, being attended with no effervescence. The people of India suppose the difference to proceed from an original, effential inferiority in the quality of the metal: but I believe that our chymists allow of no disparity of this kind, nor any but what proceeds from the greater or less quantity of alloy. In Lampoon, a very little gold is now and then discovered, but of this latter kind, the mas moodo, only.

Before the gold dust is weighed for sale; in order to cleanse it from

Mode of cleaning the gold.

all impurities, and heterogeneous mixtures, whether natural or fraudu-Ient; a skilful person, called a Pandi, is employed; who by the sharpness of his eye alone, is able to effect this to a surprizing degree of nicety; owing to long experience and practice. No Englishman but one, a Mr. Saul, was ever known to attain to this art. The dust is fpread out on a kind of wooden platter, and the base particles (lanchong) are touched out, and put aside, one by one, with an instrument which the Pandi holds in his hand, made of linen cloth rolled up to a point. If the honefty of these gold cleaners can be depended upon, their dexterity is almost infallible; and as some security for the former, it is usual to pour the parcels when cleanfed, into a veffel of aqua fortis, which is a powerful test of their accuracy. In those parts where gold is much traficked in, it is generally employed as currency, every man carries his scales about him, and purchases are made with it, so low as to the weight of a grain Gold weights, or two of paddee. Various berries are also used as weights, particularly a little red species, with a black spot, which we call India peas. The most established weight in trade, is the tial or tael, which differs however in the northern and fouthern parts of the island, being at Natal twenty four penny weights, nine grains, and at Padang, Bencoolen and else where, twenty fix penny weights, twelve grains. At Acheen the Buncal, of one ounce, ten penny weight and twenty one grains, is the standard. The Spanish dollars are every where current, and where the gold dust is not in circulation, the following diminutions are for the most part adopted:

Coins.

the foocoo, an imaginary money, equal to the fourth part of a dollar: the o ang or fanam; larger than those of Madras, but coined there; being the twenty fourth part of a dollar; of these there are likewise double and treble pieces; and laftly the kepping or copper cash, of which one hundred constitute a Spanish dollar; which is always valued on the West coast at five shillings sterling. I do not know that gold, or any other metal, is coined by any native power on the island: though it is faid to have been formerly done at Acheen and Pedir.

Tin (timar); copper (tombago); iron (beffee); have been already Tin. spoken of in the beginning of this work. The tin is a very confiderable article of trade, and many cargoes of it are yearly carried to China; for the most part in tompanes or small pieces, and sometimes in slabs. The mines, which are faid to be mostly on Banca, and to have been accidentally discovered there in 1710 by the burning of a house; are worked by a colony of Chinese, under the direction of the Dutch at Palembang, who endeavour to monopolize the trade; but the enterprizing spirit of private merchants, finds means to elude the vigilance of their cruizers, and the commerce is largely participated by them. copper, which feems of good quality, is chiefly collected in the neighbourhood of Nalaboo. The Malays are fond of mixing this metal with gold, in equal quantities, making what they term fooallo, which is much used for buttons, beetle boxes, and heads of creeses. Sulphur, (blayrang): arfenic, (barrangan); and faltpetre (meffeeoo moonta) are also the Saltpetre. produce of Sumatra. In the country of Cattown, near the head of Oori river, there are caves, from the foil found in which, the faltpetre is procured. Some few of our Company's fervants have penetrated a confiderable way into them. Mr. Whalfeldt advanced into one, seven hundred and forty three feet, when his lights were extinguished by the damp vapor. In a fecond he advanced fix hundred feet, through a narrow paffage, about three feet wide, and five in height, when an opening in a rock led to a spacious place, forty feet high.* These caves are the habi-

Mr. Christopher Terry and Mr. Charles Miller visited the same cave.

Nn

tation

tation of innumerable birds, of the swallow kind, which he perceived to abound the more, the farther he proceeded. Their nests are formed about the upper parts of the cave, and it is their dung simply, that forms the soil (in many places from four to fix feet deep, and from sifteen to twenty broad), which affords the nitre. A cubic foot of this earth, measuring seven bamboos or gallons, produced on boiling seven pounds, fourteen ounces of saltpetre; and a second experiment gave a ninth part more. This I afterwards saw refined to a high degree of purity; but I conceive that it's value would not repay the expence of the process.

Bees wax.

Bees wax is a commodity of great importance in all the eastern islands, and is from them exported to China, Bengal, and other parts of the continent. No pains is taken with the bees, which are left to fettle where they lift, and are never collected in hives. The quality of the honey, is much inferior to what we have in England.

Ivory.

Elephant.

The forests abounding with elephants (gaja), ivory is of course in plenty, and is carried both to China and Europe. Excepting a few of these, kept for state by the King of Acheen, they are not tamed in any part of the island. As they are gregarious, and usually traverse the country in large troops together, they prove highly deftructive to the plantations of the natives, obliterating the traces of cultivation, by merely walking through the grounds; but they are also fond of the produce of their gardens, particularly of plantain trees and the fugar cane, which they devour with eagerness. This indulgence of appetite often proves fatal to them, for the owners knowing their attachment to these vegetables, have a practice of poisoning some part of the plantation, by splitting the canes and putting barrangan into the clift; which the animal unwarily eats of and dies. Not being by nature carniverous, the elephants are not fierce, and feldom attack a man, but when fired at, or otherwise provoked. The rhinoceros (budda) is also a native of these woods, and his horn is efteemed an antidote against poison. I cannot vouch for the stories told of their mutual antipathy, and the desperate encounters between these two enormous beasts.

The

The birds neft, fo much celebrated as a peculiar delicacy of the table, Birds Nefts. especially among the Chinese, is found in different parts, but in the greatest abundance about Croee, near the south end of the island. Four miles up the river of that name, is a large cave, where the birds, called layong layong, and which appear to be the common martin, build in vaft numbers. The nefts are diffinguished into white and black, of which the first are by far the more scarce and valuable, * being found in the proportion of one only to twenty five.

The white fort fells in China, at the rate of a thousand to fifteen hundred Spanish dollars the pecul; the black is usually disposed of at Batavia for about twenty dollars the same weight, where I understand it is chiefly converted into glue, of which it makes a very fuperior kind. difference between the two, has by fome been supposed to be owing to the mixture of the feathers of the bird, with the viscous substance, of which the nefts are formed; and this they deduce from the experiment, of steeping the black nests for a short time in hot water, when they are faid to become, in a great degree, white. Among the natives I have heard a few affert, that they are the work of a different species of bird, It was fuggested to me, that the white might probably be the recent nests of the season in which they were taken, and the black, such as had been used for a number of years successively. This opinion appearing plaufible, I was particular in my enquiries as to that point, and learned what feemed much to corroborate it. When the natives prepare to take the nefts, they enter the caves with torches, and forming ladders according to the usual mode, of a fingle bamboo notched, they ascend and pull down the nefts, which adhere in numbers together, from the fide and top of the rock. They informed me, that the more frequently and regularly the cave is stript, the greater proportion of white nests they are fure to find, and that on this experience they often make a practice of beating down and destroying the old nests, in larger quantities than they

^{*} I had an opportuity of giving to the British Museum, some of these white nests, with eggs in them. Those found in the Saltpetre caves before mentioned, are probably of the same species. of bird.

trouble themselves to carry away, in order that they may find white nests the next season in their room. The birds, during the building time, are seen in large flocks on the beach, collecting in their bills the soam which is thrown up by the surf, of which there is tittle doubt but they construct their nests; after it has undergone, perhaps, a preparation, from a commixture with their saliva, or other secretion, with which nature has provided them for that purpose. The soallo, or sea slug, is also an article of trade, to China and Batavia; being employed, as the birds nest and vermicelli, for enriching soups, among a luxurious people.

Import Trade.

The general articles of import trade, are the following. From the coast of Coromandel, falt; long cloth, blue and white; chintz, and a variety of other cotton goods: from Bengal, opium and taffetas: from China, coarse porcelain; some tobacco; quallies or iron pans, and a number of small miscellaneous commodities: from the eastern islands, Bugguess clouting, a course, striped, cotton manufacture, much worn; guns called rantakkers; creefes and other weapons; filken creefe belts; toodongs or hats; falt of a large grain; and fometimes rice, especially from the island of Bally: from Europe, filver; iron; steel; lead; cutlery and other hardware; brass wire; and scarlet cloth. It is not within my plan to enlarge upon this fubject, or to enter into a detail of the markets and prices of the various articles, which, as in all countries where commerce is in it's infancy or decline, are extremely fluctuating. The different species of goods above enumerated, come, for the most part, under confideration in other places of the work, as they happen to be connected with the account of the natives who purchase them.

face to find, and that on this experience they often make a practice of

Arts and Manufactures .- Art of Medicine. - Sciences .- Arithmetic: Miss Geography: Aftronomy: Music, &c.

I SHALL now take a view of those arts and manufactures which the Sumatrans are skilled in, and which are not merely domestic, but contributing rather to the conveniences, and in some instances to the lux- nusactures. uries, than to the necessaries of life. I must remind the reader that my observations on this subject, are mostly drawn from the Rejangs, or those people of the island, who are upon their level of improvement. We meet with accounts in old writers, of great founderies of cannon in the dominion of Acheen, and it is certain, that fire arms, as well as creefes. are at this day manufactured in the country of Menangcabow; but my present description does not go to those superior exertions of art, which certainly do not appear among those people of the island whose manners, more especially, I am attempting to delineate. What follows would seem an exception, however, from this limitation. There is no manufacture in that part of the world; and perhaps I might be justified in faying, in any part of the world; that has been more admired and celebrated, than the fine gold and filver fillagree of Sumatra. This however is, strictly speaking, the work of the Malay, and not of the original inhabitants; but as it Fillagree, is in universal use and wear throughout the country, and as the goldsmiths are fettled every where along the coast, I cannot be guilty of much irregularity in describing here the process of their art.

There is no circumstance that renders the fillagree a matter of greater curiofity, than the coarseness of the tools employed in the workmanship, and which, in the hands of an European, would not be thought fufficiently perfect for the most ordinary purposes. They are rudely and inartificially formed, by the goldsmith (pandi), from any old iron he can pick up. When you engage one of them to execute a piece of work his first request is usually for a piece of iron hoop, to make his wiredrawing instrument: an old hammer head, stuck in a block, serves for

an anvil; and I have feen a pair of compasses, composed of two old nails tied together at one end. The gold is melted in a piece of a preece or earthen rice pot, or fometimes in a crucible of their own make, of ordinary clay. In general they use no bellows, but blow the fire with their mouths, through a joint of bamboo, and if the quantity of metal to be melted is confiderable, three or four persons fit round their furnace; which is an old broken quallee or iron pot; and blow together. At Padang alone, where the manufacture is more confiderable, they have adopted the Chinese bellows. Their method of drawing the wire, differs but little from that used by European workmen. When drawn to a fufficient fineness, they flatten it, by beating it on their anvil; and when flattened they give it a twift, like that in the whalebone handle of a punchladle, by rubbing it on a block of wood, with a flat stick. After twifting they again beat it on the anvil, and by these means it becomes flat wire with indented edges. With a pair of nippers they fold down the end of this wire, and thus form a leaf, or element of a flower in their work, which is cut off. The end is again folded and cut off. till they have got a fufficient number of leaves, which are all laid on fingly. Patterns of the flowers or foliage, in which there is not very much variety, are prepared on paper, of the fize of the gold plate on which the fillagree is to be laid. According to this, they begin to difpose on the plate, the larger compartments of the foliage, for which they use plain flat wire of a larger fize, and fill them up with the leaves before mentioned. To fix their work they employ a glutinous fubstance. made of the red berry called booa fago, ground to a pulp, on a rough flone. This pulp they place on a young coconut, about the fize of a walnut, the top and bottom being cut off. I at first imagined that caprice alone might have directed them to the use of the coconut for this purpose: but I have fince reflected on the probability of the juice of the young fruit being necessary to keep the pulp moift, which would otherwise speedily become dry and unfit for the work. After that the leaves have been all placed in order, and stuck on, bit by bit, a folder is prepared of gold filings and borax, moistened with water, which they ftrew over the plate, and then putting it in the fire for a fhort time,

the

SUMATRA

the whole becomes united. This kind of work on a gold plate, they call carrang papan: when the work is open, they call it carrang troufe. In executing the latter, the foliage is laid out on a card, or foft kind of wood, and fluck on, as before described with the sago berry; and the work, when finished, being strewed over their solder, is put into the fire, when the card or foft wood burning away, the gold remains connected. If the piece be large, they folder it at feveral times. In the manufacture of badjoo buttons, they first make the lower part flat, and having a mould formed of a piece of buffaloe's horn, indented to feveral fizes, each like one half of a bullet mould, they lay their work over one of these holes. and with a horn punch, they press it into the form of the button. After this they complete the upper part. When the fillagree is finished, they cleanse it, by boiling it in water, with common salt and allum, or sometimes lime juice; and in order to give it that fine purple color which they call fapo, they boil it in water with brimstone. The manner of making the little balls, with which their works are fometimes ornamented, is as follows. They take a piece of charcoal, and having cut it flat and smooth, they make in it a small hole, which they fill with gold dust, and this melted in the fire, becomes a little ball. They are very inexpert at finishing and polishing the plain parts, hinges, screws, and the like, being in this as much excelled by the European artists, as these fall short of them, in the fineness and minuteness of the foliage. The Chinese also make fillagree, mostly of filver, which looks elegant, but wants likewife, the extraordinary delicacy of the Malay work. The price of the workmanship depends upon the difficulty or uncommonness of the pattern. In some articles of usual demand, it does not exceed one third of the value of the gold; but in matters of fancy, it is generally equal to it. The manufacture is not now held in very high effimation in England, where coftliness is not so much the object of luxury, as variety; but in the revolution of taste, it may probably be again fought after and admired as fashionable.

But little skill is shewn amongst the country people in forging iron. Iron Manu-They make nails however, though not much used by them in building, wooden pins being generally substituted; also various kinds of tools, as

GP In

the prang or bill, the banchee, rembay, billiong and papateel, which are different species of adzes, the capa or ax and the pancoor or hoc. Their fire is made with charcoal; the fossil coal which the country produces being rarely, if ever; employed, except by the Europeans.* Their bellows are thus constructed. Two bamboos of about four inches diameter and five feet in length, stand perpendicularly, near the fire; open at the upper end, and stopt below. About an inch or two from the bottom, a small joint of bamboo is inserted into each, which serve as nozles, pointing to, and meeting at the fire. To produce a stream of air, bunches of feathers or other soft substance, being sastened to long handles, are worked up and down in the upright tubes, like the piston of a pump. These when pushed downwards, force the air through the small horizontal tubes; and by raising and sinking each alternately, a continual current or blast is kept up; for which purpose a boy is usually placed on a high seat or stand.

Carpenter's

work.

Tools,

The progress they have made in carpenter's work has been already pointed out, where their buildings were described. They are ignorant of the use of the saw, excepting where we have introduced it among them. Trees are felled by chopping at the stems, and in procuring boards, they are confined to those, the direction of whose grain, or other qualities, admit of their being easily split asunder. In this respect the maranti and maraceoly have the preference. The tree, being stripped of its branches and its bark, is cut into the length required, and by the help of wedges, split into boards. These being of irregular thickness, are usually dubbed upon the spot. The tool used for this purpose is the rembay, the corners of which turn up towards the workmen, to prevent their catching in the board; but this seems an unnecassary precaution. Most of their smaller work, and particularly on the bamboo, is performed with the papateel, which resembles in shape, as much as in name, the patoopatoo of the New Zelanders, but has the vast superiority of

being

^{*} And not by them of late years, yet the report made of it in 1719 was, that it gave a furer beat than the coal from England: the bed of it (though described rather as a large rock above ground) lies four days journey up Bencoolen river, from whence quantities are washed down by the sloods.

being made of iron. The blade, being fastened to the handle with a curious kind of basket work of split rattans, is so contrived as to turn in it, and by that means can be employed either as an adze or finall hatchet. Their houses are generally built with the affiftance of this simple instrument alone. The billiong is no other than a large papateel, with a handle of two or three feet in length, turning like that, in its focket...

The chief cement they use, is made of the curd of the buffaloe milk, Cements. called prackee. It is to be observed that butter is made (for the use of Europeans only*) not as with us, by churning, but by letting the milk stand till the butter forms of itself on the top. It is then taken off with a fpoon, ftirred about with the fame in a flat veffel, and well washed in two or three waters. The thick four milk left at the bottom, when the butter or cream is removed, is what I term the curd. This must be well squezeed, formed into cakes and left to dry, when it will: grow nearly as hard as flint. For use, you must scrape some of it off, mix it with quick lime and moisten it with milk. I think that there is no stronger cement in the world, and it is found to hold, particularly in a hot and damp climate, much better than glue; proving also effectual in mending china ware. The viscous juice of a particular berry, is likewife used in the country as a cement.

Painting and drawing they are quite strangers to. In carving, both Defigning. in wood and ivory, they are curious and fanciful, but their defigns are always grotefque and out of nature. The handles of the creefes are the most common subjects of their ingenuity in this art, which usually exhibit the head and back of a bird, with the folded arms of a human creature, not unlike the representation of one of the Egyptian deities. In cane and basket work they are particularly neat and expert; as well as inmats, of which fome kinds are much prized.

^{*} The words used by the Malays, for butter and cheese, are Monteiga and Queijo, which are pure Portuguefe.

Looms,

Silk and cotton cloths, of varied colors, manufactured by themselves, are worn by the natives in all parts of the country; especially by the women. Some of their work is very fine, and the patterns prettily fancied. Their loom or apparatus for weaving (tunnone) is extremely defective, and renders their progress tedious. One end of the warp being made fast to a frame, the whole is kept tight, and the web stretched out by means of a species of yoke, which fastens behind the body, as the person weaving fits down. Every second of the longitudinal threads, paffes feparately through a fet of reeds, like the teeth of a comb, and the alternate ones through another fet. These are forced home at each return of the shuttle, rendering the warp close and even. The alternate threads of the warp crofs each other, up and down, to admit the shuttle, not from the extremities, as in our looms, nor effected by the feet, but by turning edge ways two flat flicks which pass through. shuttle (toorah) is a hollow reed, about fixteen inches long, generally ornamented on the outfide, and closed at one end, having in it a small bit of stick, on which is rolled the woof or shoot. The filk clouts have ufually a gold head. They use sometimes another kind of loom, still more fimple than this, being no more than a frame in which the warp is fixed, and the woof darned with a long, small pointed shuttle. They make use of a machine for spinning the cotton very like ours. women are expert at embroidery, the gold and filver thread for which, is procured from China, as well as their needles. For common work, their thread is the poolay before mentioned, or filaments of the pefang (musa).

Earthenware.

Different kinds of earthenware, I have elsewhere observed, are mafactured on the island.

Perfumes.

They have a practice of perfuming their hair with oil of benjamin, which they distill themselves from the gum, by a process doubtless of their own invention. In procuring it, a preess, or earthen rice pot, covered close, is used for a retort. A small bamboo is inserted in the side of the vessel, and well luted with clay and ashes, from which the oil drops

drops as lit comes over. Along with the benjamin they put into the retort, a mixture of fugar cane and other articles, that contribute little or nothing to the quantity or quality of the distillation; but no liquid is added. This empyreumatic oil is valued among them at a high price. and can only be used by the superior rank of people.

The oil in general use is that of the coconut, which is procured in the oa. following manner. The fleshy part being scraped out of the nut, which for this use must be old, is exposed for some time to the heat of the sun. It is then put into a mat bag, and placed in the press (campauban) between two floping timbers, which are fixed together in a focket in the lower part of the frame, and forced towards each other by wedges in a groove at top, compressing, by this means, the pulp of the nut, which yields an oil, that falls into a trough made for its reception below. In the farther parts of the country, this oil also, owing to the scarcity of coconuts, is dear, and not fo much used for burning as the dammar or rosin, which is always at hand. When travelling at night they make use of torches or Torcheslinks, called fooloo, the common fort of which are nothing more than dried bamboos of a convenient length, beaten at the joints, till split in every part; without the addition of any refinous or other inflammable fubstance. A superior kind is made by filling with dammar a young bamboo, about a cubit long, well dried, and the outer skin taken off.

tigers, which are alarmed at the appearance of fire; and for the fame the tigers. reason it is common to make a blaze with wood, in different parts round their villages. The tigers prove to the inhabitants, both in their journeys and even their domestic occupations, most fatal and destructive enemies. The number of people annually flain by these rapacious tyrants of the woods, is almost incredible. I have known instances of whole

villages being depopulated by them. Yet, from a superstitious prejudice, it is with difficulty they are prevailed upon, by a large reward which the India Company offers, to use methods of destroying them; till they have fustained some particular injury in their own family or kin-

These torches are carried with a view, chiefly, to frighten away the carried to

thefe animals.

dred.

dred. Their traps, of which they can make variety, are very ingeniously contrived. Sometimes they are in the nature of strong cages, with falling doors, into which the beaft is enticed by a goat or dog enclosed as a bait; fometimes they manage that a large timber shall fall, in a groove, across his back : fometimes he is noofed about the loins with strong rattans; fometimes is led to afcend a plank, nearly balanced, which turning when he is past the center, lets him fall upon sharp stakes prepared below. Instances have occurred of a tiger being caught by one of the former modes, which had many marks in his body of the partial success of this last expedient. The escapes, at times, made from them by the natives are truly furprizing, but these accounts in general carry too romantic an air to admit of being repeated as facts. The fize and strength of the species which prevails on this island is prodigious. They are said to break with a stroke of their fore paw, the leg of a horse or a buffaloe; and the largest prey they kill is without difficulty dragged by them into the woods. This they usually perform on the second night, being supposed, on the first, to gratify themselves with sucking the blood only. Time is by this delay afforded to prepare for their destruction; and to the methods already enumerated, befide shooting them, I should add that of placing a veffel of water, flrongly impregnated with arfenic, near the carcase, which is fastened to a tree to prevent its being carried off. tiger having fatiated himfelf with the flesh, is prompted to affuage his thirst, with the tempting liquor at hand, and perishes in the indulgence. Their chief subfistence is most probably, the unfortunate monkeys with which the woods abound. They are de cribed as alluring them to their fate, by a fascinating power, fimilar to what has been supposed of the fnake, and I am not incredulous enough to treat the idea with contempt, having myself observed that when an aligator or crocadile, in a river, comes under an overhanging bough of a tree, the monkies, in a flate of alarm and deftraction, crowd to the extremity, and chattering and trembling, approach nearer and nearer to the amphibious monfter that waits to devour them as they drop, which their fright and number renders almost unavoidable. These aligators likewise occasion the loss of many inhabitants, frequently destroying the people as they bathe in the

And of aliga-

river, according to their regular cuftom, and which the perpetual evidence of the risk attending it, cannot deter them from. A superstitious idea of their fanctity also, preserves them from molestation, although, with a hook of fufficient strength, they may be taken without much difficulty. A musket ball appears to have no effect upon their impenetrable hides.

Befides the common methods of taking fish; of which the feas that Fishing. wash the coasts of Sumatra afford an extraordinary variety and abundance; the natives employ a mode, unpractifed, I apprehend, in any part of Europe. They steep the root of a certain creeping plant, called toobo, of strong narcotic qualities, in the water where the fish are observed, which produces such an effect, that they become intoxicated and to appearance dead, float on the furface of the water, and are taken with the hand. This is generally made use of in the basons of water, formed by the ledges of coral rock, which, having no outlet, are left full when the tide has ebbed.* Birds, particularly the plover (cherooling) and quails (pocyoo), are caught by fnares or fpringes laid for them in the grafs. Bird catching. These are of ejoo, which resembles horsehair, many fathoms in length, and disposed in such a manner that their feet get entangled; for which purpose they are gently drove towards the snares. In some parts of the country they make use of clasp nets. I never observed a Sumatran to fire a fhot at a bird, though many of them, as well as the more eaftern people, have a remarkable fine aim; but the mode of letting off the matchlocks, which are the pieces most habitual to them, precludes the possibility of shooting flying. Gunpowder is manufactured in various Gunpowder. parts of the island, but less in the country I am more particularly speak-

^{*} In Captain Cook's second voyage is a plate representing a plant used for the same purpose at Otaheite, which is the exact delineation of one whose appearance I am well acquainted with on Sumatra, and which abounds in many parts of the fea beach; but though its qualities be fimilar to those of the toobo, the latter is a different plant, being a vine or creeper. In South America also, we are informed, the inhabitants procure fish after this extraordinary manner, employing three different kind of plants; but whether any of them be the same with that of Otaheite or Sumatra, I am ignorant.

ing of, and to the fouthward in general, than amongst the people of Menangcabow, the Battas and Achenese, whose frequent wars demand large supplies. It is made, as with us, of proportions of charcoal, sulphur and nitre, but the composition is very imperfectly granulated, being often hastily prepared, in small quantities, for immediate use. The last article, though found in greatest quantity in the saltpetre-caves before spoken of, is most commonly procured from goat's dung, which is always to be had in plenty.

Sugar.

The Jaggree or country fugar is usually made from the juice of the anou, a species of palm tree, extracted in the manner already described. In some places, but rarely, they press the sugar cane for this purpose, in a mill, the rollers of which are worked by the endless screw, instead of coggs; one of the two, which is longer than the other, having a bar through it that is turned by the hand. The juice is fimply boiled till a confiftence is formed, but scarcely at all granulated, being little more than a thick fyrup. This is made into cakes, spread upon leaves to dry, and afterwards lapt up in oopee or the inner bark of the penang tree. This jaggree, befide its ordinary uses as sugar, being mixed with lime, makes a fine cement for building, and an exquisite plaster for walls, which in some parts of India equals marble in appearance. The liquor of the anoucalled necroo or toddy, is drunk whilft fresh, and proves an agreeable beverage, It is also made use of in a fermented state, to effect which a composition is employed called raggee; and a quantity of rice being at the fame time steeped in it, the liquor then becomes intoxicating, and is called brum. This is in fact the basis of the spirit called arrack, but the Sumatrans have not the art of diffilling it.* The Malays, when re-

^{*} Many attempts have been made by the English to bring to perfection the manufacture of fugar and arrack from the canes: but the expences, particularly of the slaves, were always found to exceed the advantages. Within these few years, that the plantations and works were committed to the management of Mr. Henry Botham; it has manifestly appeared that the end is to be obtained, by employing the Chinese in the works of the field, and allowing them a proportion of the produce, for their labor. The manufacture had arrived at a considerable extent, when the breaking out of the war gave a check to it's progress: but the path is pointed out, and it is worth pursuing with vigor. The sums of money thrown into Batavia for arrack and sugar have been immense.

strained from the use of opium, are apt to have recourse to this liquor, but among the country people inebriation is perfectly rare.

Salt is here, as in most other countries, an article of general consump- Salt. tion. The demand for it is mostly supplied by cargoes imported, but they also manufacture it themselves.* The method is tedious. They kindle a fire close to the sea beach, and pour upon it sea water, by degrees. When this has been continued for a certain time the water evaporating, and the falt being precipitated among the ashes, they gather these in baskets, or in funnels made of the bark or leaves of trees, and again pour sea water on them, till the particles of falt are well separated, and pass, with the water, into a vessel placed below to receive them. This water, now strongly impregnated, is boiled till the salt adheres in a thick crust to the bottom and sides of the vessel. In burning a square fathom of firewood, a skilful person procures about five gallons of salt. What is thus made, has so considerable a mixture of the salt of the wood, that it foon diffolves, and cannot be carried far into the country. The coarfest grain is preferred.

The art of medicine, among the Sumatrans, confifts almost entirely Art of mediin the application of fimples, in the virtues of which they are furprizingly skilled. Every old man and woman is a physician; their rewards depending upon their fuccess; but they generally procure a small sum in advance, under the pretext of purchasing charms . The mode of prac-

and comercines a pot of boiling herbs, is enclosed in the covering

* In one of the earliest letters from Bencoolen, to the Presidency of Madrass, it is mentioned that Salt could not be disposed of as an article of trade.

⁺ Charms are there worn about the necks of children, as in Europe. I know not what they are composed of, nor is it of much consequence, being merely impositions of the Malay priests. A charm against an ague I once accidentally met with, which from circumstances I conclude to be a translation of fuch as are employed by the Portuguese Christians in India. Though not properly belonging to my fubject, I will present it to the reader. " (Sign of the cross). When Christ faw the cross, he trembled and shaked; and they said unto him, hast thou an ague? and he faid unto them, I have neither ague nor fever; and whofoever bears these words, either in writing or in mind, shall never be troubled with ague or fever. So help thy fervants, O Lord,

wardly, or by applying outwardly a poultice of leaves chopped small, upon the breast or part effected, renewing it as soon as it becomes dry. For internal pains, they rub oil on a large leaf of a stimulant quality, and heating it before the fire, clap it on the body of the patient, as a blister, which produces very powerful effects. Phlebotomy they never use, yet the people of the neighbouring island of Neas, are samous for their skill in cupping, which they practice in a manner peculiar to themselves.

Fevers.

In fevers they give a decoction of the herb lakoon, and bathe the patient, for two or three mornings, in warm water. If this does not prove effectual, they pour over him, during the paroxysm, a quantity of cold water, rendered more chilly by the daoun sedingin, which, from the sudden revulsion it causes, brings on a copious perspiration. Pains and swellings in the limbs, are likewise cured by sweating; but for this purpose, they either cover themselves over with mats, and sit in the sunshine at noon, or if the operation be performed within doors, a lamp, and sometimes a pot of boiling herbs, is enclosed in the covering with them. Homes a state of the parameter of the parameter of the operation of the parameter of the parameter

Leprofy.

There are two species of leprofy known in these parts. The milder fort, or impetigo; as I apprehend it to be; is very common among the inhabitants of Neas; great numbers of whom are covered with a white four or scales, that render them loathsome to the sight. But this distemper, though disagreeable from the violent itching and other inconveniences with which it is attended, does not appear immediately to affect the health; slaves in that situation being daily bought and sold for field and other out-door work. It is communicated from parents to their

in the application of imples, in the virtues of which they are turpriz-

who put their trust in thee!" From the many folds that appear in the original, I have reason to apprehend that it had been worn, and by some Englishman, whom frequent sickness and the fond love of life, had rendered weak and superstitious enough to try the effects of this barbarous and ridiculous quackery.

The state of the stat

offspring, but though hereditary, it is not contagious. I have fometimes been induced to think it nothing more than a confirmed stage of the ferpigo or ringworm, or it may be the fame with what is elfewhere termed the shingles. I have known a Neas man who has effected a temporary removal of this fcurf, by the frequent application of fuch herbs as are used to cure the ringworm, and sometimes by rubbing gunpowder and strong acids to his skin; but it always returned after fome time. The other species, with which the country people are in fome inftances affected, is doubtless the elephantiasis, from the description given of its dreadful symptoms; the skin coming off in flakes, and the flesh falling from the bones, as in the lues venerea. This diforder being esteemed highly infectious, the unhappy wretch who labors under it, is driven from the village he belonged to, into the woods, where victuals are left for him, from time to time, by his relations. A prang and a knife are likewise delivered to him, that he may build himself a hut, which is generally erected near to fome river, continual bathing being supposed to have some effect in removing the disorder, or alleviating the misery of the patient. Few inflances of recovery have been known. There is a defeafe called the nambee which bears fome affinity to this, attacking the feet chiefly, the flesh of which it eats away. As none but the lowest class of people feem to fuffer from this complaint, I imagine it proceeds in a great degree from want of cleanlinefs.

The small pox sometimes visits the island and makes terrible ravages. Small pox-It is regarded as a plague, and drives from the country thousands whom the infection spares. Their method of stopping its progress; for they do not attempt a cure; is by converting into an hospital or receptacle for the rest, that village where lie the greatest number of sick, whither they fend all who are attacked by the diforder, from the country round. The most effectual methods are pursued to prevent any person's escape from this village, which is burnt to the ground as foon as the infection has spent itself, or devoured all the victims thus offered to it. Inoculation feems to be an idea not thought of, and as it could not be universal, it might be a dangerous experiment for Europeans to introduce it par-Rr tially.

tially, in a country where the disorder makes its appearance at distant intervals only; unless those periods could be seized, and the attempts made, when and where there might be well sounded apprehension of its being communicated in the natural way. A distemper much resembling the small pox, and in its first stages mistaken for it, is not uncommon. It causes an alarm, but does not prove mortal, and is probably what we term the chicken pox.

Venereal difcafe. The venereal disease, though common in the Malay bazars, is in the inland country almost unknown. A man returning to his village, with the infection, is shunned by the inhabitants as an unclean and interdicted person. The Malays cure it with the decoction of a china root, called by them gadoong, which causes a salivation.

Infanity.

When a man is by fickness, or otherwise, deprived of his reason, or when subject to convulsion fits, they imagine him possessed by an evil spirit, and their ceremony of exorcism, is by putting the unfortunate wretch into a hut, which they set fire to about his ears, suffering him to make his escape through the slames in the best manner he can. The fright, which would go nigh to destroy the intellects of a reasonable man, may perhaps have, under contrary circumstances, an opposite effect.

Sciences. Arithmetic. The skill of the Sumatrans in any of the sciences, is, as may be prefumed, very limited. Some, however, I have met with, who, in arithmetic, could multiply and divide, by a single multiplier or divisor, several places of sigures. Tens of thousands (laxa) are the highest class of numbers the Malay language has a name for. In counting over a quantity of small articles, each tenth, and afterwards each hundredth piece, is put aside; which method is just consonant with the progress of scientific numeration, and probably was the origin of it. When they may have occasion to recollect at a distance of time, the sale of any commodities they are carrying to market, or the like, the country people often assist their memory, by tying knots on a string, which is produced when they want to specify the number. The Peruvian quipos were, I suppose, an improvement upon this simple invention.

They

They estimate the quantity of most species of merchandize by what Measures, we call dry measure, the use of weights being apparently introduced among them by foreigners; for the pecul and cattee are used only on the fea coast, and places which the Malays frequent *. The coolab or bamboo, containing very nearly a gallon, is the general standard of measure among the Rejangs: of these eight hundred make a coyan: the choopa is one quarter of a bamboo. By the bamboo almost all articles, even elephants teeth, are bought and fold; but by a bamboo of ivory. they mean fo much as is equal in weight to a bamboo of rice. This still includes the idea of weight, but is not attended with their principal objection to that mode of afcertaining quantity, which arises, as they fay, from the impossibility of judging by the eye of the justness of artificial weights, owing to the various materials of which they may be composed, and which measurement is not liable to. The measures of length here, as perhaps originally among every people upon earth, are taken from the dimensions of the human body. The deppo. or fathom, is the extent of the arms from each extremity of the fingers: the etto, or cubit, is the forearm and hand: cakee is the foot: janca is the span; and jarree, which signifies a finger, is the inch. These are estimated from the general proportions of middle fized men; others making an allowance in measuring; and not regulated by any exact Standard-

fea, are perfectly confined, or rather they entertain none. They know not that the country they inhabit is an island, nor have they any general name for it. Habit renders them expert in travelling through the woods, where they perform journeys of weeks and months without seeing a habitation. In places little frequented, where they have occasion to strike

idea of interculation, preferred of

out new paths; for roads there are none; they make marks on trees for the future guidance of themselves and others. I have heard a man say,

The pecul is 133 1b: 100 cattees are one pecul, each being estimated at a pound and a third.

The ideas of Geography, among such of them as do not frequent the Geography.

"I will attempt a paffage by fuch a route, for my father, when living, told me that he had left his tokens there." They estimate the distance of places from each other, by the number of days, or the proportion of the day, taken up in travelling it, and not by measurement of the space. Their journey, or day's walk, may be computed at about twenty miles; but they can bear a long continuance of satigue.

Chronology.

The Malays, as well as the Arabs and other Mahometan nations, fix the length of the year at three hundred and fifty four days, or twelve lunar months of twenty nine days and an half; by which mode of reckoning, each year is thrown back above eleven days. The original Sumatrans rudely estimate their annual periods, from the revolution of the feafons, and count their years from the number of their crops of grain (taoun paddee); a practice, which, though not pretending to accuracy, is much more useful for the general purposes of life, than the former, which is merely adapted to religious observances. They, as well as the Malays, compute time by regular lunar periods, but do not attempt to trace any relation or correspondence, between these smaller measures and the folar revolution. Whilst more polished nations were multiplying mistakes and difficulties, in their endeavors to ascertain the completion of the fun's course through the ecliptic, and in the mean while suffering their nominal feafons to become almost the reverse of nature, these people without an idea of intercalation, preserved the account of their years free from effential, or at least progressive error, and the confusion which attends it. The division of the month into weeks I believe to be unknown; except where it has been taught with Mahometanism; the day of the moon's age being used instead of it, where accuracy is required; nor do they fubdivide the day into hours. To denote the time of day, at which any circumstance they find it necessary to speak of, happened, they point with their finger, to the height in the fky, at which the fun then flood. And this mode is the more general and precife, as the fun, fo near the equator, ascends and descends almost perpendicularly, and rifes and fets, at all feafons of the year, within a few minutes of fix o'clock. Scarce any of the stars or constellations are diftinguished

Aftronomy.

tinguished by them. They notice, however, the planet Venus, but do not imagine her to be the same at the different periods of her revolution; when the precedes the rifing and follows the fetting fun. They are aware of the night on which the new moon should make it's appearance, and the Malays falute it with the discharge of guns. They also know when to expect the returns of the tides, which are at their height. on the west coast, when that luminary is in the horizon, and ebb as it rifes. When they observe a bright star near the moon, they are apprehenfive of a storm; as European sailors foretell a gale from the sharpness of her horns. These are both, in part, the consequences of an unufual clearness in the air; which proceeding from an extraordinary alteration of the state of the atmosphere, must naturally be followed by a violent rushing of the circumiacent parts, to restore the equilibrium; and thus prove a prognostic of high wind. During an eclipse they make a loud noise with founding instruments, to prevent one luminary from devouring the other, as the Chinese, to frighten away the dragon. They tell of a man in the moon, who is continually employed in spinning cotton, but that every night a rat gnaws his thread, and obliges him to begin his work afresh. This they apply as an emblem of endless and ineffectual labor, like the stone of Sifyphus, and the sieves of the Danaides.

History and chronology they are entirely without; the memory of all past events being preserved by tradition only.

They are fond of mufic, and have many instruments in use among Music, them, but few, upon enquiry, appear to be original, being mostly borrowed from the Chinese and other more eastern people; particularly the the calintang, gong, and sooleen. The violin has found it's way to them from the westward. The calintang resembles the stoccado and the harmonica; the more common ones having the crofs pieces; which are struck with two little hammers; of split bamboo, and the more perfect. of a certain composition of metal which is very sonorous. The gongs, a kind of bell, but differing much in shape, and struck on the outside,

are cast in sets regularly tuned to thirds, fourth, fifth, and octave, and often ferve as a base, or under part, to the calintang. The sooleen is the Malay flute. The country flute is called ferdum. It is made of bamboo, is very imperfect, having but few stops, and refembles much an instrument described as found among the people of Otaheite. A fingle hole underneath, is covered with the thumb of the left hand, and the hole nearest the end at which it is blown, on the upper fide, with a finger of the same hand. The other two holes are stopt with the right hand fingers. In blowing they hold it inclined to the right fide. They have various instruments of the drum kind, particularly those called tinkah, which are in pairs, and beaten with the hands at each end. They are made of a certain kind of wood hollowed out, covered with dried goat fkins, and laced with split rattans. It is difficult to obtain a proper knowledge of their division of the scale, as they know nothing of it in theory. The interval we call an octave, feems to be divided with them into fix tones, without any intermediate femitones, which must confine their mufic to one key. It confifts in general of but few notes. and the third is the interval that most frequently occurs. Those who perform on the violin, use the same notes as in our division, and they tune the instrument, by fifths, to a great nicety. They are fond of playing the octave, but scarce use any other chord. The Sumatran tunesvery much refemble, to my ear, those of the native Irish, and have usually, like them, a flat third. Voting one year veologorio bae vrolidil past events being preserved by tradition only.

They are fond of mufic, and have many inframents in all among them, but few, upon gaquiry, appear to be original, being mostly burstowed from the Chinese and other more eastern people; particularly the

a kind of boll, but differing much in Shape, and firmly on the ontake

Language-Malay-Arabic character used-Languages of the interior people—Peculiar characters—Specimens of languages and of alphabets.

REFORE I proceed to an account of the laws, customs and manners of Languages. the people of the island, it is necessary that I should say something of the different languages spoken on it; the diversity of which has been the fubject of much contemplation and conjecture.

The Malay language, which is original in the peninfula of Malayo, and Malayo, has from thence extended itself throughout the eastern islands, so as to become the lingua frança of that part of the globe, is spoken every where along the coasts of Sumatra, prevails in the inland country of Menanycabow and its immediate dependencies, and is understood in almost every part of the ifland. It has been much celebrated, and juftly, for the smoothness and sweetness of its found, which have gained it the appellation of the Italian of the east. This is owing to the prevalence of vowels and liquids in the words, and the infrequency of any harsh combination. of mute confonants. These qualities render it well adapted to poetry, which the Malays are passionately addicted to. They amuse all their leifure hours, including the greater portion of their lives, with the repetition of fongs, which are, for the most part, proverbs illustrated, or Songs. figures of speech applied to the occurrences of life. Some that they rehearfe, in a kind of recitative, at their bimbangs or feasts, are historical love tales, like our old English ballads, but often extempore. An example of the former species is as follows.

Apo goono passang paleeto,

Callo teedah dangan soomboonia?

Apo goono bermine matto,

Callo teeda dangan soongoonia?

What fignifies attempting to light a lamp, If the wick be wanting? What fignifies making love with the eyes, If nothing in earnest be intended?

It must be observed however, that it often proves a very difficult matter to trace the connexion between the figurative and the literal fense of the stanza. The effentials in the composition of the pantoon; for such these little pieces are called; the longer being called dendang; are the rythmus and the figure, particularly the latter, which they confider as the life and spirit of the poetry. I had a proof of this in an attempt which I made, to impose a pantoon of my own composing, on the natives, as a work of their countrymen. The fubject was a dialogue between a lover, and a rich, coy mistres: The expressions were proper to the occasion, and in some degree characteristic. It passed with several, but an old lady who was a more difcerning critic than the others, remarked that it was " catto catto sajo"-mere conversation; meaning that it was destitute of the quaint and figurative expressions which adorn their own poetry. Their language, in common speaking, is proverbial and sententious. If a young woman prove with child before marriage, they obferve it is, douloo booa, cadeean boongo"-" the fruit before the flower." Hearing of a person's death, they say, " nen mattee, mattee; nen cedoop, becrajo: callo sampi-la janjeenia, apo boolee booat?"-" those who are dead, are dead; those who survive must work: if his allotted time was expired, what resource is there ?*"

Their

^{*} The " apo boolee booat" is a phrase they always make use of, to express their sense of inequitability, and has more force than any translation of it I can employ.

racter used by

Their writing is in the Arabic character, very little corrupted, owing Arabic chato which, and the adoption of their religion from the same quarter, a Malays. great number of Arabic words are incorporated with the Malay. The Portuguese too have furnished them with many terms, chiefly for such ideas as they have acquired fince the period of European discoveries to the eastward. They write on paper, using ink of their own composition, with pens made of the twig of the Anou tree. I could never difcover that the Malays had any original written characters, peculiar to themselves, before they acquired those now in use; but it is possible that fuch might have been loft; a fate that may hereafter attend those of Sumatra, on which the Arabic daily makes encroachments. Yet I have had frequent occasion to observe the Malay language written by inland people, in the country character; which would indicate that the fpeech is likely to perish first. Their books are for the most part, either transscripts from the Alcoran (koraan) or legendary tales (kabar); of little merit as compositions.

The pureft, or most esteemed Malay is said, and with great appearance of reason, to be spoken at Malacca. It differs from the dialect used on Sumatra chiefly in this, that words, in the latter, made to terminate in "O," are, in the former, founded as ending in "A." Thus they pronounce lada (pepper) instead of lado. Those words which end with a "K" in writing, are, on Sumatra, always foftened in speaking, by omitting it; as "table bunnia," "many compliments," for "tablek bunniak;" but the Malaccans; and especially the more eastern people, who fpeak very broad; give them generally the full found. The perfonal pronouns also differ materially in the respective countries.

Attempts have been made to compose a Grammar of the Malay tongue, upon the principles on which those of the European languages are formed. But the abfurdity of fuch productions is obvious. Where there is no inflexion of either nouns or verbs, there can be no cases, declenfions, moods, or conjugations. All this is performed by the addition

of certain words expressive of a determinate meaning, which should not be confidered as mere auxiliaries, or as particles subservient to other words. Thus, in the instance of Rooma, a house; " derree pada rooma" fignifies " from a house"; but it would be talking without use or meaning, to fay that derree pada is the fign of the ablative case of that noun, for then every proposition should equally require an appropriate case, and as well as " of" " to" and "from," we should have a case for " deatas rooma"-" on top of the house". So of verbs: "callo sayo boolee gellan"-" if I could walk:" this may be termed the preter-imperfect tense of the fubjunctive or potential mood, of the verb gellan; whereas it is in fact a fentence, of which gellan, boolee, &c. are constituent words.* It is improper, I fay, to talk of the case of a noun, which does not change its termination, or the mood of a verb, which does not alter its form. An useful set of observations might be collected, for speaking the language with correctness and propriety, but they must be asdifferent from the artificial and technical rules of our grammarians, as the dress of an European lady, from the simplicity of a Malay habit.

Interior people ufe languages different from the Malay. Befide the Malay there are a variety of languages spoken on Sumatra, which, however, have not only a manifest affinity among themselves, but also to that general language which is found to prevail in, and to be indigenous to all the islands of the eastern sea; from Madagascar to the remotest of Captain Cooke's discoveries; comprehending a wider extent than the Roman, or any other tongue, has yet boasted. Indisputable examples of this connexion and similarity, I have exhibited in a paper which the Society of Antiquaries have done me the honor to publish in their Archaiologia. In different places it has been more or less

mixed

^{*} Bowrey, who has written on this subject, constitutes his suture tense, of the word "maoo," thus, "camee maoo bacha," which is, "we chuse, or are inclined to read," To form the Passive voice, he says the particle "ber" is to be presixed, but he is mistakan, for "I send this letter" is expressed in Malay, by "sayo ber-kerim soorat innee." These endeavors to square every thing to our own local and partial ideas, puts me in mind of some vocabularies I have seen, in which the country Titles were thus explained—Pangeran—a Duke: Dattoo—an Earl: Dupatty—a Lord Mayor.

mixed and corrupted, but between the most dissimilar branches, an evident fameness of many radical words is apparent; and in some, very distant from each other in point of situation; as for instance the Philippines and Madagascar; the deviation of the words is scarcely more than is observed in the dialects of neighbouring provinces of the same kingdom.*

The principal internal languages of Sumatra, are the Rejang and the Batta, whose difference is marked, not so much by the want of correst- culiar writing pondence in the terms, as by the circumstance of their being each expressed in a distinct and peculiar written character. This I conceive to be extraordinary, and perhaps fingular, in the history of human improvement; that two divisions of people on the same island, with equal claims to originality, in stages of civilization nearly equal, and speaking languages derived from the same source, should write in characters effentially different from each other, and from the rest of the world. What corroborates the evidence of the alphabets being separate and unconnected inventions, is, that the order of the letters is not the fame; as will appear by an inspection of the specimens I have subjoined for the gratification of the curious . The Achenese making use of the Arabic character, their language has the less claim to originality. The Lampoon, as a dialect, is fufficiently diffinct from all the others, but a few of the letters of the alphabet, particularly the first and second, are expressed by characters manifestly the same with the Rejang, though the major part feem entirely unlike. Perhaps, as the Greeks are faid to have

They have pecharacters.

^{*} I am engaged in an attempt to render this comparison of languages more extensive, and as far as possible, to bring specimens of all those spoken in the known world, into one point of view.

⁺ See the following plate. The Javanese, and all other eastern writing, that I have examined. differ as much from these, as the Rejang from the Batta. The specimen of a Javan alphabet given in Corneille le Brun is very just. The Togala alphabet is to be found in Thevenot. Relation des Isles Philipines.

done in the days of Cadmus, the Lampoons may have borrowed from their neighbours, in order to complete the number of their letters. All these people, in writing, form their lines from the left hand towards the right, contrary to the practice of the Malays and the Arabians.

Write on bark of trees.

and on bam-

Their writings, of any bulk and importance, are executed, with ink, on the inner bark of a tree, cut into narrow strips of considerable length, and folded together in squares; each square or fold answering for a page. On more common occasions they write on the outer coat of a joint of bamboo; sometimes whole, and sometimes split into pieces of two or three inches in breadth; with the point of their creese or other weapon, which serves the purpose of a stylus.* These writings or scratchings rather, are often performed with a considerable degree of neatness; of which I have specimens in my possession, as well as of their larger works. The proportion of those among the natives who can read and write, particularly the Battas, is very great, and perhaps not surpassed in many countries of Europe.

None of these languages are so harmonious as the Malay, and the Lampoon in particular is very guttural, making frequent use of the sound we denote by "gh", which they introduce even in Malay words; and liquifying the consonant "r". Thus the word Croee, they pronounce Cogb-ee, and bras they change into beeas.

In Java, Siam, and other parts of the east, beside the common language of the country, there is established a court language, spoken by

The Chinese are said, by their historians, to have written on pieces of Bamboo, before they invented paper.

[†] It is remarkable that the Malays cannot express the consonant F, or Ph, nor the people of the island Neas, near Sumatra, the consonant P. The same distinction is observed amongst the inhabitants of some of the South Sea islands, and I believe holds good with respect to the Persians and Arabians.

persons of rank only. This distinction, artfully invented for the purpose of keeping the vulgar at a distance, and inspiring them with respect for what they cannot understand, does not take place in any part of Sumatra, among the inhabitants of which, disparity of situation is not attended with much reserve, or distance of behaviour between the persons.

Landers and the fortentes, who exhibit a pitture of marking in

Comparative flate of the Sumatrans in civil fociety-Difference of Character between the Malay and other inhabitants. Government-Titles and power of the chiefs among the Rejangs. ence of the Europeans-Government in Passummah.

reference which our attenuents in feience, and effectally in mechanica

ONSIDERED as a people occupying a certain rank in the fcale Comparative of civil fociety, it is not eafy to determine the proper fituation of the inhabitants of this island. Though far distant from that point to which the polifhed states of Europe have aspired, they yet look down, with an interval almost as great, on the savage tribes of Africa and America. Perhaps if we diffinguish mankind fummarily into five classes; but of which each would admit of numberless subdivisions; we might affign a third place, to the more civilized Sumatrans, and a fourth, to the remainder. In the first class, I should of course include some of the republics of ancient Greece, in the days of their splendor; the Romans. for some time before and after the Augustine age; France, England, and other refined nations of Europe, in the latter centuries, and perhaps China. The fecond might comprehend the great Afiatic empires at the period of their prosperity; Perlia, the Mogul, the Turkish, with some European kingdoms. In the third class, along with the Sumatrans, Xoloans, and a few other states of the eastern archipelago, I should rank the nations on the northern coast of Africa, and the more polished Arabs. The fourth class, with the less civilized Sumatrans, will take in the people of the new discovered islands in the South Sea; perhaps the celebrated Mexican and Peruvian empires; the Tartar hoards, and all those societies of people in various parts of the globe, who, possessing perfonal property, and acknowledging fome species of established subordination, rife one step above the Carribs, the New Hollanders, the Laplanders,

flare of fociety.

Laplanders, and the Hottentots, who exhibit a picture of mankind in it's rudest and most humiliating aspect.*

Few improvements adopted from the Europeans. As mankind are by nature so prone to imitation, it may seem surprizing that these people have not derived a greater share of improvement, in manners and arts, from their long connexion with Europeans, particularly with the English, who have now been settled among them for an hundred years. Though strongly attached to their own habits, they are nevertheless sensible of their inferiority, and readily admit the preference which our attainments in science, and especially in mechanics, intitle us to. I have heard a man exclaim, after contemplating the structure and uses of a house clock, "Is it not sitting that such as we, should be slaves to people who have the ingenuity to invent, and the skill to construct, so wonderful a machine as this?" "The sun," he added, "is a machine of this nature. But who winds it up, said his companion? Who but Allab, replied he".

Causes of this.

Some probable causes of this backwardness may be suggested. We carry on few or no species of manufacture at our settlements: every thing is imported ready wrought to it's highest perfection: the natives have no opportunity of examining the first process, or the progress of the work. Abundantly supplied with every article of convenience from Europe, and prejudiced in their favor because from thence, we make but little use of the raw materials Sumatra affords. We do not spin it's cotton; we do not rear it's filk-worms; we do not smelt it's metals; we do not even hew it's stone: neglecting these, it is in vain we would exhibit to the people for their improvement in the arts, our rich brocades, our time-pieces, or display to them, in drawings, the elegance

^{*} There are three scales, pointed out by different writers (Le Poivre, Robertson, and Richardson) by which to measure and ascertain the state of civilization any people have arrived at: the one is the degree of perfection of their agriculture; another, their progress in the art of numeration; and a third the number of abstract terms in their language. Forming a judgment by these tests, the reader will be able to determine with what share of propriety I have assigned the above ranks to the Sumatrans.

of our architecture. Our manners likewise are little calculated to excite their approval and imitation. Not to infift on the licentiousness that has at times been imputed to our communities; the pleasures of the table; emulation in wine; boisterous mirth; juvenile frolics, and puerile amusements, which do not pass without serious. perhaps contemptuous, animadversion-setting these aside, it appears to me, that even our best models are but ill adapted for the imitation of a rude, incurious, and unambitious people. Their fenses, not their reason, should be acted on, to rouse them from their lethargy; their imaginations must be warmed; a spirit of enthusiasm must pervade and animate them, before they will exchange the pleasures of indolence for those of industry. The philosophical influence that prevails, and characterises the present age, in the western world, is unfavorable to the producing these effects. A modern man of sense and manners, defpifes, or endeavours to despife, ceremony, parade, attendance, superfluous and splendid ornaments in his dress or furniture: preferring ease and convenience, to cumbrous pomp, the person first in rank is no longer distinguished by his apparel, his equipage, or his number of servants. from those inferior to him; and though possessing real power, is divested of almost every external mark of it. Even our religious worship partakes of the same simplicity. It is far from my intention to condemn or depreciate these manners, considered in a general scale of estimation. Probably, in proportion as the prejudices of fense are diffipated by the light of reason, we advance towards the highest degree of perfection our natures are capable of. Possibly perfection may confist in a certain medium which we have already got beyond; but certainly all this refinement is utterly incomprehenfible to an uncivilized mind, which cannot discriminate the ideas of humility and meanness. We appear to the Sumatrans to have degenerated from the more splendid virtues of our predecessors. Even the richness of their laced suits, and the gravity of their perukes, attracted a degree of admiration; and I have heard the difuse of the large hoops worn by the ladies, pathetically lamented. The quick, and to them inexplicable, revolutions of our fashions, are fubject of much aftonishment, and they naturally conclude, that those thuisting

modes can have but little intrinsic merit which we are so ready to change; or at least that our caprice renders us very incompetent to be the guides of their improvement. Indeed, in matters of this kind, it is not to be supposed that an imitation should take place, owing to the total incongruity of manners in other respects, and the diffimilarity of natural and local circumstances. But perhaps I am superfluously investigating minute and partial causes of an effect, which one general one may be thought sufficient to produce. Under the frigid, and more especially the torrid zone, the inhabitants will naturally preserve an uninterrupted similarity and consistency of manners, from the uniform influence of their climate. In the temperate zones, where this influence is equivocal, the manners will be fluctuating, and dependant rather on moral than on physical causes.

Difference in character between the Malays and other Sumatrans.

The Malay and pative Sumatran differ more in the features of their mind than in those of their person. Although we know not that this island, in the revolutions of human grandeur ever made a distinguished figure in the history of the world, (for the Achenese, though powerful in the fixteenth century, were very low in point of civilization), yet the Malay inhabitants have an appearance of degeneracy, and this renders their character totally different from that which we conceive of a favage; however justly their ferocious spirit of plunder on the eastern coast, may have drawn upon them that name. They feem rather to be finking into obscurity, though with opportunities of improvement, than emerging from thence, to a state of civil or political importance. They retain a ftrong share of pride, but not of that laudable kind which restrains men from the commission of mean and fraudulent actions. They poffers much low cunning and plaufible duplicity, and know how to diffemble the strongest passions and most inveterate antipathy, beneath the utmost composure of features, till the opportunity of gratifying their refentment offers. Veracity, gratitude, and integrity are not to be found in the list of their virtues, and their minds are almost totally strangers to the sentiments of honor and infamy. They are jealous and vindictive. Their courage is defultory, the effect of a momentary enthufiafm,

thufiafm, which enables them to perform deeds of incredible desperation. but they are firangers to that fleady magnanimity, that cool heroic refolution in battle, which conflitutes in our idea the perfection of this quality, and renders it a virtue.* Yet it must be observed, that from an apathy almost paradoxical, they suffer under sentence of death, in cases where no indignant paffions could operate to buoy up the mind to a contempt of punishment, with astonishing composure and indifference; uttering little more on these occasions, than a proverbial faying, common among them, expressive of the inevitability of fate-" apo boolee booat"? To this stoicism, their belief in predestination, and very imperfect idea of a future, eternal existence, doubtless contribute.

Some writer has remarked, that a resemblance is usually found, between the disposition and qualities of the beasts proper to any country, and those of the indigenous inhabitants of the human species, where an intercourse with foreigners has not destroyed the genuineness of their character. The Malay may be compared to the buffaloe and the tiger. In his domestic state, he is indolent, stubborn, and voluptuous as the former, and in his adventurous life, he is infiduous, blood-thirsty and rapacious as the latter. Thus the Arab is faid to refemble his camel, and the placid Gentoo his cow.

The original Sumatran, though he partakes in some degree of the Character of Malay vices, and partly from the contagion of example, possesses many native Sumaexclusive virtues; but they are more properly of the negative than the positive kind. He is mild, peaceable, and forbearing, unless his anger be roused by violent provocation, when he is implacable in his resentments. He is temperate and fober, being equally abstemious in meat and drink. The diet of the natives is mostly vegetable; water is their only beverage; and though they will kill a fowl or a goat for a stranger, whom perhaps they never faw before, nor ever expect to fee again, they

^{*} In the history of the Portuguese wars in this part of the east, there appears some exception to this remark, and particularly in the character of Lacfemanna, who was truly a great man and most confummate warrior.

are rarely guilty of that extravagance for themselves; nor even at their festivals (bimbang) where there is a plenty of meat, do they eat much of any thing but rice. Their hospitality is extreme, and bounded by their ability alone. Their manners are fimple; they are generally, except among the chiefs, devoid of the Malay cunning and chicane; yet endued with a quickness of apprehension, and on many occasions discovering a confiderable degree of penetration and fagacity. In respect to women, they are remarkably continent, without any share of insensibility. They are modest; particularly guarded in their expressions; courteous in their behaviour; grave in their deportment, being feldom or never excited to laughter; and patient to a great degree. On the other hand they are litigious; indolent; addicted to gaming; dishonest in their dealings with strangers, which they esteem no moral defect; suspicious; regardless of truth; mean in their transactions; servile; though cleanly in their persons, dirty in their apparel which they never wash. They are careless and improvident of the future, because their wants are few, for though poor, they are not necessitous; nature supplying with extraordinary facility, whatever the has made requifite for their existence Science and the arts have not, by extending their views, contributed to enlarge the circle of their defires; and the various refinements of luxury, which in polished societies become necessaries of life, are totally unknown to them.*

Government.

Having endeavoured to trace the character of these people, with as much fidelity and accuracy as possible, I shall now proceed to give an account of their government, laws, customs, and manners; and in order to convey to the reader, the clearest ideas in my power, I shall develope the various circumstances in such order and connexion, as shall

The people from Macassar and Bugguess who come annually in their praws to trade at Sumatra, are looked up to by the inhabitants, as their superiors in manners. The Malays affect to copy their style of dress, and frequent allusions to the feats and atchievements of these people are made in their songs. Their reputation for courage, which certainly surpasses that of all other people in the eastern seas, acquires them this flattering distinction. They also derive part of the respect paid them, from the richness of the cargoes they import, and the spirit with which they spend the produce in gaming, cock-sighting, and opium smoaking.

appear best to answer this intent, without confining myself, in every inftance, to a rigid and forupulous arrangement into diffinct heads.

The inhabitants of the Rejang country live in villages or doofoons, each under the government of a magistrate styled Dupatty. His depen-Rejangs. dants are termed Ana-booa,* and in number feldom exceed one hundred. A certain proportion of the dupatties belonging to each river; the villages being always fituated by the water fide; rare chosen to meet in a legislative or judicial capacity, at the qualloe or river's mouth, and these are distinguished by the name of Proatteen. The Pangeran or Pangeran prince of the country, prefides over the whole. I would point out in what confifts the fealty of a dupatty to a pangeran, and of his ana booa to him, but fo very little is to be observed in either case, that it is not an easy matter to describe it. Almost without arts, and with but little industry, the state of property is nearly equal among all the inhabitants, and the chiefs scarcely differ but in title, from the bulk of the people. Their authority is no more than nominal, being without that coercive His authority. power, necessary to make themselves feared and implicitly obeyed. This is the natural refult of poverty among nations habituated to peace; where the two great political engines of interest and military force are wanting. Their government is founded in opinion, and the fubmission of the people is voluntary. The domestic rule of a private family, beyond a doubt, fuggested first the idea of government in society, and this people having made but fmall advances in civil policy, theirs retains a strong resemblance of its original. It is connected also with the principle of the feudal fystem, into which it would probably settle, should it attain to a greater degree of refinement. All the other governments throughout the island, are likewise a mixture of the patriarchal and feudal; and it may be observed, that where a spirit of conquest has reduced the inha-

Government among the

or chief.

^{*} Apparently a figurative expression, from fruit hanging on a tree.

[†] The names which we usually apply to countries or districts, belong properly to the rivers; and it is, with the natives, more common to fay, the people of fuch a river, than of fuch a country. Rivers in Europe divide provinces, but in India they are confidered as running through the center of them.

bitants under the subjection of another power, or has added foreign districts to their dominion, there the feudal maxims prevail: where the natives, from fituation or disposition, have long remained undisturbed by revolutions, there the fimplicity of patriarchal rule obtains; which is not only the first, and natural form of government, of all rude nations rifing from imperceptible beginnings, but is perhaps also the highest state of perfection they can ultimately arrive at. It is not in this art alone that we perceive the next step from consummate refinement, leading to fimplicity.

The foundation of right to government among these people, seems, Much limited. as I faid, to be the general confent. If a chief exerts an undue authority, or departs from their long established customs and usages, they conceive themselves at liberty to relinquish their allegiance. A commanding aspect, an infinuating manner, a ready fluency in discourse, and a penetration and fagacity in unravelling the little intricacies of their difputes, are qualities which feldom fail to procure to their possessor, refpect and influence, fometimes perhaps fuperior to that of an acknowledged chief. The pangeran indeed claims despotic sway, and as far as he can find the means, scruples not to exert it; but his revenues being infufficient to enable him to keep up any force, for carrying his mandates into execution, his actual powers are very limited, and he has feldom found himself able to punish a turbulent subject, any otherwise than by private affaffination. In appointing the heads of doofoons, he does little more than confirm the choice already made among the inhabitants, and was he arbitrarily to name a person of a different tribe, or from another place, he would not be obeyed. He levies no tax nor has any revenue, (what he derives from the India Company being out of the question) or emolument from his subjects, other than what accrues to him from the determination of causes. Appeals lie to him in all cases, and none of the inferior courts, or affemblies of proatteens, are competent for life and death. But all punishments being, by the laws of the country, commutable for fines, and the appeals being attended with expence and loss of time, the parties generally abide by the first decision. Those doofoons

doofoons which are fituated nearest to the residence of the pangeran, at Soongey-lamo, acknowledge formewhat more of subordination than the distant ones, which, even in case of war, esteem themselves at liberty to affift or not, as they think proper, without being liable to confequences. In answer to a question on this point, " we are his subjects not his slaves," replied one of the proatteens. But from the pangeran you hear a tale widely different. He has been known to fay, in a political conversation; "fuch and fuch doofoons, there will be no trouble with: they are my powder and fhot;" explaining himfelf by adding, that he could dispose of the inhabitants, as his ancestors had done, to purchase ammunition in a fundy held in elector, and this the old men all held seminated

ne fining by his fide in judgment on the little dif-

The father of Pangeran Munco Raja (whose name is preserved from Origin of the title of panoblivion by the part he took in the expulsion of the English from Fort geran in Re-Marlborough in the year 1719) was the first who bore the title of pangeran of Soongey-lamo. He had before been fimply Beginda Sebyam. Till about an hundred years ago, the fouthern coast of Sumatra, as far as Oori river, was dependent on the king of Bantam, whose Jennang (lieutenant or deputy) came yearly to Silebar or Bencoolen, collected the pepper, and filled up the vacancies, by nominating, or rather confirming in their election, the preatteens. Soon after that time; the English having established a settlement at Bencoolen; the jennang informed the chiefs that he should visit them no more, and raising the two head men of Soongey-lamo and Soongey-etam, * to the dignity of pangeran, gave into their hands the government of the country, and withdrew his mafter's claim. Such is the account given by the present possessors, of the origin of their titles, which nearly corresponds with the recorded transactions of the period. It followed naturally that the pangeran should lay claim to the absolute authority of the king whom he represented, and that the proatteens should still consider him but as one of themselves, and pay him little more than nominal obedience. He had no power to enforce

bonne Bonned

^{*} The latter is chief of the Lemba country, in the neighbourhood of Bencoolen river; on which however, the former poffesses some villages, and is chief of the Rejang tribes. In a reliable

his plea, and they retain their privileges, taking no oath of allegiance, nor submitting to be bound by any positive engagement. They speak of him however with respect, and in any moderate requisition, that does not affect their addat or customs, they are ready enough to aid him, (tolong, as they express it) but rather as matter of favor, than acknowledged obligation.

The exemption the *Dupatties* contend for, from abfolute subjection, they allow in turn to their ana-booas, whom they govern by the influence of opinion only. The respect paid to a Dupatty, is little more than as to an Elder of a family held in esteem, and this the old men of the doofoon share with him; sitting by his side in judgment on the little differences that arise among themselves. If they cannot determine the cause, or the dispute be with one of a separate village, the proatteens of the same tribe that live adjacent, meet for the purpose. From these litigations arise some small emoluments to the dupatty, whose dignity, in other respects, is rather an expence than an advantage. In the erection of public works, such as their Balli or town hall, he contributes a larger share of materials. He receives and entertains all strangers; his dependants furnishing their quotas of provision, on particular occasions; and their hospitality is such, that food and lodging are never resused to those who ask it.

Succession of Dupatties.

Though the rank of dupatty be not strictly hereditary, the son, when of age, and capable, generally succeeds the father, at his decease; if too young, the father's brother, or such one of the family as appears most qualified, assumes the post; not as a regent, but in his own right; and the minor comes in perhaps at the next vacancy.

dem no more, and

Tribes.

The Rejangs are distinguished into tribes, the descendants of a different pooyang or ancestor. Of these there are four principal tribes, foorcallang, Beremannie, Seloopo and Toobye; said to derive their origin from four brothers, and to have been united from time immemorial in a league offensive and desensive: the permanency however of this bond, may be conjectured

conjectured to have been owing to the expediency refulting from their fituation, rather than their confanguinity, or any formal compact. There are also several inferior tribes.

Each river or district, (for it is by the rivers the parts of the country are diffinguished) and indeed each doofoon, is independent of, though not unconnected with, it's neighbours; acting in concert, only by fpecific confent. On every river there is at least one Pambarab or superior proatteen, who differs from the rest, in the right of presiding at those fuits and feftivals, in which two or more doofoons have a common concern, with a larger allotment of fines and provision.* If more tribes than one are fettled on the fame river, each has usually it's pambarab, who is chosen by the respective proatteens: these are chosen in like manner by the dupatties, but with the concurrence of the elders of the doofoon. If the choice displeases any of the inhabitants, they agree among themselves what chief they will follow, and remove to his doosoon. There is no restraint or compulsion in the case. Sometimes a few families separate themselves, and elect a chief, but without contesting the right of him whom they leave. The chiefs do not however affume the title of dupatty, without being confirmed by the pangeran, or by the Company's Refident, who in truth exercises many of the functions of fovereignty.

The fystem of government among the people near the sea coast, who, Insuence of towards the fouthern extreme of the island, are the planters of pepper, the Inpany. is much influenced by the power of the Europeans, who are virtually the lords paramount. The advantages derived to the subject from their fway, both in a political and civil fense, are infinitely greater than perfons at a diffance are usually inclined to suppose. Oppressions may be fometimes complained of at the hands of individuals, but, to the honor of the Company's fervice let me add, they have been very rare, and

^{*} The most distinguished of the heroes of the Iliad were served at table with a larger proportion of chines

of inconfiderable magnitude. Where a degree of discretionary power is intrufted to fingle persons, abuses will, in the nature of things, arise in fome inftances; cases may occur, in which the private passions of the Refident, will interfere with his public duty; but the door has ever been open for redress, and examples have been made. To destroy this influence and authority in order to prevent these consequences, were to cut off a limb in order to remove a partial complaint. By the Company's power, the districts over which it extends, are preserved in uninterrupted peace. How invaluable a bleffing this, let Poland, let America, let other desolated countries speak. Were it not for this power, every doofoon of every river, would be at war with it's neighbour. The natives themselves allow it, and it was evinced, even in the short space of time the English were absent from the coast, in the former war with France. Hostilities of district against district, so frequent among the independent nations to the northward, are, in the Company's jurisdiction, things unheard of; and those difinal catastrophes, which, in all the Malay islands, are wont to attend on private feuds, but very rarely happen. "I tell you honeftly" faid a dupatty, much irritated against one of his neighbours. "that it is only you," pointing to the Resident of Laye, "that prevent my plunging this weapon into his breaft." The Refident is also confidered as the protector of the people, from the injustice and oppression of the chiefs. This oppression, though not carried on in the way of open force, which the ill-defined nature of their authority would not support, is scarcely less grievous to the sufferer. Expounders of the law, and deeply versed in the chicanery of it, they are ever lying in wait to take advantage of the necessitous and ignorant, till they have stripped them of their property, their family, and their liberty. To prevent these practices; the partial administration of justice in consequence of bribes; the fubornation of witnesses; and the like iniquities, a continual exertion of the Resident's attention and authority is required; and as that authority is accidentally relaxed, the country falls into confusion.

It is true, that this interference is not strictly consonant with the fpirit of the original contracts, entered into by the Company with the native chiefs, who, in confideration of protection from their enemies; regular purchase of the produce of their country; and a gratuity to themselves, proportioned to the quantity of that produce. undertake, on their part, to oblige their dependants to plant pepper; to refrain from the use of opium, the practice of gaming, and other vicious excesses; and to punish them in case of non-compliance. But however prudent or equal these contracts might have been at the time their form was established, a change of circumstances; the gradual and neceffary increase of the Company's sway, which the peace and good of the country required; the tacit consent of the chiefs themselves, (among whom the oldest living has never been used to regard the Company, who have conferred on them their respective dignities, as their equals, or as trading in their districts upon sufferance) has long antiquated them: and custom and experience have imroduced in their room, an influence on one fide, and a fubordination on the other, more confistent with the power of the Company, and more fuitable to the benefits derived from the moderate and humane exercise of that power. Prescription has given it's fanction to this change, and the people have fubmitted to it without murmuring; as it was introduced, not fuddenly, but with the natural course of events, and bettered the condition of the whole, while it tended to curb the rapacity of the few. Then let not short fighted or defigning persons, upon false principles of justice, or ill-digested notions of liberty, rashly endeavour to overturn a scheme of government, doubtless not perfect, but which seems best adapted to the circumftances it has respect to, and attended with the fewest disadvantages. Let them not vainly exert themselves to procure redress of imaginary grievances, for perfons who complain not, or to infuse a spirit of freedom and independence, in a climate where nature apparently never intended they should flourish, and which, if obtained, would inevitably he attended with effects, that all their advantages would badly compenfate.

Leilies

Government in Paffummah. In Passummah, which nearly borders upon Rejang, to the fouthward, there appears some difference in the mode of government, though the same spirit pervades both; the chiefs being equally without a regular coercive power, and the people equally free in the choice of whom they will serve. This is an extensive, and, comparatively, populous country, bounded on the northwest by that of Lamattang, and on the southeast by that of Lampoon; the river of Padang-gochie marking the division from the latter, near the sea coast. It is distinguished into Passummah lebbar, or the broad, which lies inland, extending to within a day's journey of Movaro Moolang, on Palembang river; and Passummah coloo Manna, which is on the western side of the range of hills, whither the inhabitants are said to have mostly removed, in order to avoid the government of the Dutch.

Passummah is governed by four pangerans, who are perfectly independent of each other, but they acknowledge a kind of sovereignty in the Sultan of Palembang, from whom they hold a chop (warrant) and receive a saling (investiture), on their accession.* This subordination is the consequence of the king of Bamtam's former influence over this part of the island, Palembang being a port at that time dependant on him, and still on the Dutch, whose instrument the sultan is; and the people are for the greater part Javans. There is an inserior pangeran in almost every doosoon; that title being nearly as common in Passummah, as dupatty towards the sea coast; who are chosen by the inhabitants of the doosoon, and confirmed by the superior pangeran, whom they affist in the determination of causes. In the low country, where the pepper planters reside, whose race is mixed with colonists from Rejang and a place

^{*} The Grand Signior in like manner fends a vest and turban to his great vasfals.

th "A king of Bantam, in 1596, fell before Palinban, a rebel town of Sumatra which he was belieging; and the fiege was raifed thereupon." Navigations aux Ind. Ori. 1609.

Pangeran is properly a Javanese title, introduced on Sumatra, and prevailing only in the southern part.

called Hadjee, the title of Calippab is found. Each of these preside over various tribes, which have been collected at different times, and have ranged themselves, some under one, and some under another chies; having also their superior proatteen, or pambarab, as to the northward. On the rivers of Peeno, Manna and Bankannon, are two calippahs respectively, some of whom are also pangerans, which last seems to be here rather a title of honor, or family distinction, than of magistracy. They are independent of each other, owning no superior; and their number, according to the ideas of the people, cannot be increased.

which is founded on using and general confect. The chiefs, in proponent from the chiefs, in proponential their decimals, are not beard to fay. It to the law directly had "fach is the comom." Laws

Laws and customs-Mode of deciding Causes-Code of Laws.

Laws or cuf-

HERE is no word in the languages of the island which properly and strictly fignifies Law; nor is there any person or class of persons, among the Rejangs, regularly invested with a legislative power. They are governed in their various disputes, by a set of long established customs (addat), handed down to them from their ancestors, the authority of which is founded on usage and general confent. The chiefs, in pronouncing their decisions, are not heard to fay, " fo the law directs" but, " fuch is the custom." It is true, that if any case arises, for which there is no precedent on record (of memory), they deliberate and agree on fome mode, that shall serve as a rule in future fimilar circumstances. If the affair be trifling, this is feldom objected to, but when it is a matter of confequence, the pangeran, or calippah, confults with the proatteens, or lower order of chiefs, who frequently defire time to confider of it, and confult with the inhabitants of their doofoon. When the point is thus determined, the people voluntarily submit to observe it as an eftablished custom; but they do not acknowledge a right in the chiefs, to constitute what laws they think proper, or to repeal or alter their ancient usages, which they are extremely tenacious and jealous of. It is notwithstanding true, that by the influence of the Europeans, they have at times been prevailed on, to submit to innovations in their addat; but, except when they perceived a manifest advantage from the change, they have generally feized an opportunity of reverting to the old mode.

Mode of deciding causes. All causes, both civil and criminal, are determined by the several chiefs of the district, assembled together, at stated times, for the purpose of distributing justice. These meetings are called becharro (which signifies also to discourse or debate), and among us, by an easy corruption, bechars. Their manner of settling their litigations, in points of property, is rather a species of arbitration, each party previously binding himself

to submit to the decision, than through a coercive power possessed by the court, for the redrefs of wrongs, to somevisido sati va

The want of a written criterion of the laws, and the imperfect stability of traditionary usage, must frequently in the intricacies of their suits. give rife to contradictory decifions; particularly as the interests and passions of the chiefs are but too often concerned in the determination of the causes that come before them. This evil had long been perceived by the English Residents, who, in the countries where we are settled, preside at the bechars, and being instigated by the splendid example of the Governor-general of Bengal, under whose direction a code of the laws of that empire was compiled, it was refolved, that the fervants of the Company at each of the subordinates, should, with the affistance of the Code of laws. ablest and most experienced of the natives, attempt to reduce to writing, and form a fystem of the usages of the country people, in their respective refidencies. This was accordingly executed in fome inflances, and a translation of that compiled in the residency of Laye; coming into my possession, I insert it here, in the original form, as being attended with more authority and precision, than any account furnished from my own memorandums, could pretend to radeed and no and wanter and all "

bee, and of fuch fines, or theres of fines, as fall to the chiefs the REJANG LAWS.

"The laws and customs of the Rejangs, hitherto preserved by tradition, are now, after being discussed, amended, and ratifyed in an " affembly of the pangeran, pambarabs and proatteens, committed to writing, in order that they may not be liable to alteration; that juftice may be regularly and impartially administered; that those de-" ferving death or fine may meet their reward; that causes may be " brought before the proper judges, and due amends made for defaults; that the compensation for murder may be fully paid; that property may be equitably divided; that what is borrowed may be reffored; "that gifts may become the undoubted property of the receiver; that debts may be paid, and credits received, agreeably to the customs

- " that have been ever in force, beneath the heavens and on the face
- of the earth. By the observance of the laws, a country is made to
- " flourish, and where they are neglected or violated, ruin ensues.

" BECHARS

Process in fuits

"The plaintiff and defendants first state to the bench the general circumstances of the case. If their accounts differ, and they consent to refer the matter to the decision of the proatteens, each party is to give a token, to the value of a foocoo, that he will abide by it, and to find fecurity for the chogo, a fum stated to them, supposed to exceed the utmost probable damages.

dollars of If the chogo do not exceed 30 the bee or fee paid by each is 1. ditto 30 to 50 Ditto 50 to 100 Ditto ditto 100 and upwards ditto Ditto

dollars

- 44 All chiefs of doofoons, or independent tallongs, are entitled to a feat on the bench upon trials. moose and modificate bas
- "If the pangeran fits on the bechar, he is entitled to one half of all beo, and of fuch fines, or shares of fines, as fall to the chiefs; the pambarabs and other proatteens dividing the remainder.
- "If the pangeran be not prefent, the pambarabs have one third, and the other proatteens two thirds of the foregoing. Though a fingle pambarab only fit, he is equally entitled to the above one third. Of the other proatteens, five are requifite to make a quorum.
- " No bechar, the chogo of which exceeds five dollars, to be held by the proatteens, except in the presence of the Company's Resident, or his affiftant (reprefenting the pangeran).
- "If a person maliciously brings a false accusation, and it is proved fuch, he is liable to pay a fum equal to that which the defendant would have incurred, had his defign fucceeded; which fum is to be divided between the defendant, and the other proatteens, half and half.

- "The fine for bearing false witness, is twenty dollars and a buffaloe.
- "The punishment of perjury is left to the superior powers (orang aloos). Evidence here is not delivered on previous oath. of mid to

"INHERITANCE.

"If the father leaves a will, or declares before witnesses his intentions Laws of inherelative to his effects or estate, his pleasure is to be followed in the diffribution of them.

- "If he dies intestate, and without declaring his intentions, the male children inherit, share and share alike, except that the house and pelakko (effects on which, from various causes, superstitious value is placed) devolve invariably to the eldeft.
- "The mother (if by joojoor) and the daughters, are dependant on the fons.
- "If a man, married by femundo, dies, leaving children, the effects remain to the wife and children. If the woman dies, the effects remain to the husband and children. If either dies, leaving no children, the family of the deceased is entitled to half the effects.

GOUTLAWRY.

- "Any person unwilling to be answerable for the debts or actions of his Of outlawry. fon, or other relation under his charge, may outlaw him, by which he, from that period, relinquishes all family connexion with him, and is no longer responsible for his conduct.
- "The outlaw to be delivered up to the Refident or pangeran, accompanied with his writ of outlawry, in duplicate, one copy to be lodged with the Refident, and one with the outlaw's pambarab.
- "The person who outlaws must pay all debts to that day.
- "On amendment the outlaw may be recalled to his family, they paying fuch debts as he may have contracted whilst outlawed, and redeeming his writ by payment of ten dollars and a goat, to be divided among the pangeran and pambarabs.

- "If an outlaw commits murder he is to fuffer death.
- "If murdered, a bangoon, or compensation, of fifty dollars, is to be paid for him to the pangeran.
- "If an outlaw wounds a person, he becomes a flave to the Company or pangeran for three years. If he absconds, and is afterwards killed, no bangoon is to be paid for him.
- "If an outlaw wounds a person, and is killed in the scuffle, no bangoon is to be paid for him.
- and become answerable for his debts.

"THEFT. Videravai evlovob (bessig

Theft.

- "A person convicted of thest, pays double the value of the goods stolen, with a fine of twenty dollars and a buffaloe, if they exceed the value of five dollars: if under five dollars, the fine is five dollars and a goat; the value of the goods still doubled.
- "All thefts under five dollars, and all disputes for property, or offences to that amount, may be compromised by the proatteens whose dependents are concerned.
- "Neither affertion, nor oath of the profecutor, are sufficient for conviction, without token (cheeno) of the robbery, viz. some article recovered of the goods stolen; or evidence sufficient.
- "If any person, having permission to pass the night in the house of another, shall leave it before day-break, without giving notice to the family, he shall be held accountable for any thing that may be that night missing.
- "If a person passing the night in the house of another, does not commit his effects to the charge of the owner of it, the latter is not accountable, if they are stolen during the night. If he has given them in charge, and the stranger's effects, only, are lost during the night, the owner of the house becomes accountable. If effects both of the

edaradang ban deregan owner

owner and lodger are stolen, each is to make oath to the other that he is not concerned in the robbery, and the parties put up with their loss, or retrieve it as they can.

Gaths are usually made on the koraan, or at the grave of an ancestor, as the Mahometan religion prevails more or less. The party intended to be satisfied by the oath, generally prescribes the mode and purport of it.

"BANGOON.

Dollars. The bangoon or compensation for the murder of a pambarab is 500 Bangoon or compensation of an inferior proatteen Ditto 250 for murder. Ditto 80 of a common person—man or boy Ditto Ditto woman or girl 150 Ditto of the legitimate children or wife of a pambarab 250

Exclusive of the above, a fine of fifty dollars and a buffaloe, as tippong boomee (expiation), is to be paid on the murder of a pambarab; of twenty dollars and a buffaloe, on the murder of any other; which goes to the pambarab and proatteens.

- "The bangoon of an outlaw is fifty dollars, without tippong boomee.
- "No bangoon is to be paid for a person killed in the commission of a robbery.
- "The bangoon of pambarabs and proatteens is to be divided between the pangeran and pambarabs; one half; and the family of the deceased; the other half.
- "The bangoon of private persons is to be paid to their families; deducting the addat oolassan of ten per cent, to the pambarabs and proatteens.
- "If a man kills his flave, he pays half his price, as bangoon, to the pangeran, and the tippong boomee to the proatteens.
- "If a man kills his wife by joojoor, he pays her bangoon to the proatteens, or to her family, according as the tallee kooloo subsists or not.

- "If a man kills or wounds his wife by femundo, he pays the fame as for a stranger.
- "If a man wounds his wife by joojeor, flightly, he pays one tial or two dollars.
- "If a man wounds his wife by joojoor, with a weapon, and an apparent intention of killing her, he pays a fine of twenty dollars,
- "If the tallee koolco (tie of relationship) is broken, the wife's family can no longer claim bangoon or fine: they revert to the proatteens.
- If a pambarab wounds his wife by joojoor, he pays five dollars and a goat.
- "If a pambarab's daughter, married by joojoor, is wounded by her husband, he pays five dollars and a goat.
- " For a wound occasioning the loss of an eye or limb, or imminent danger of death, half the bangoon is to be paid.
- "For a wound on the head, the pampay or compensation is twenty dollars.
- " For other wounds, the pampay from twenty dollars upwards.
- "If a person is carried off and sold beyond the hills, the offender, if convicted, must pay the bangoon. If the person has been recovered previous to the trial, the offender pays half the bangoon.
- " If a man kills his brother, he pays to the proatteens the tippong boomee.
- " If a wife kills her husband she must suffer death.
- "If a wife by femundo wounds her husband, her relations must pay, what they would receive, if he wounded her.

DEBTS AND CREDITS.

Debts. "On the death of a person in debt (unless he die an outlaw, or married by ambel ana) his nearest relation becomes accountable to the creditors.

" Of

- "Of a person married by ambel ana, the family he married into, is anfwerable for debts contracted during the marriage: such as were previous to it, his relations must pay.
- "A father or head of a family has hitherto been in all cases liable to the debts of his sons, or younger relations under his care; but to prevent as much as possible his suffering by their extravagance, it is now resolved.
- "That if a young, unmarried man (boojong) borrow money, or purchase goods, without the concurrence of his father, or of the head of his family, the parent shall not be answerable for the debt. Should the son use his father's name in borrowing, it shall be at the lender's risk, if the father disayow it.
- "If any person gives credit to the debtor of another (publicly known as such; mengeering or ba-bla) the latter creditor can neither disturb the debtor for the sum, nor oblige the former to pay it. He must either pay the first debt, (memboolattee, consolidate), or let his claim lie over till the debtor finds means to discharge it.
 - "Interest of money has hitherto been three fanams per dollar per month, or one hundred and fifty per cent. per annum. It is now reduced to one fanam, or fifty per cent. per annum, and no person is to receive more, under penalty of fine according to the circumstances of the case.
- "No more than double the principal can in any case be recovered at law. A person lending money at interest, and letting it lie overbeyond two years, looses the surplus.
 - "No pepper planter to be taken mengeering, under penalty of forty dollars.
- "A planter in debt may engage in any work for hire that does not interfere with the care of his garden, but must on no account mengeering, even though his creditor offer to become answerable for the care of his garden,
- "If a debtor mengeering abfcond from his mafter without leave of abfence, he is liable to an increase of debt, at the rate of three fanams

- per day. Females have been hitherto charged fix fanams, but are now put upon a footing the fame as the men.
- "If a debtor mengeering, without fecurity, runs away, his debt is liable to be doubled, if he is absent above a week.
- fhould the debtor die in that predicament, the creditor loses his money, having no claim on the relations for it.
- of If a person takes up money, under promise of mengeering, at a certain period, should he not perform his agreement, he must pay interest for the money, at one fanam per dollar per month.
- "If a person, security for another, is obliged to pay the debt, he is entitled to demand double from the debtor: but this claim to be moderated according to circumstances.
- "If a person sues for a debt which is denied, the onus probandi lies with the plaintiff. If he fails in proof, the defendant, on making oath to the justness of his denial, shall be acquitted.
- "If a debtor taking care of a pepper garden, or one that gives half produce to his creditor (ba-bla), neglects it, the person in whose debt he is, must hire a man to do the necessary work; and the hire so paid shall be added to the debt. Previous notice shall however be given to the debtor, that he may, if he pleases, avoid the payment of the hire, by doing the work himself.
- "If a person's slave, or debtor mengeering, be carried off, and sold beyond the hills, the offender is liable to the bangoon, if a debtor, or to his price, if a slave. Should the person be recovered, the offender is liable to a fine of forty dollars, of which the person that recovers him has half, and the owner, or creditor, the remainder. If the offender be not secured, the reward shall be only sive dollars to the person that brings the slave, and three dollars, the debtor, if on this side the hills: if from beyond the hills, the reward is doubled.

66 MARRIAGE

" MARRIAGE.

- The modes of marriage prevailing hitherto, have been principally by Laws regardjoojoor, or ambel ana; the Malay femundo being little used. The obvious ill consequences of the two former, from the debt or flavery they entailed upon the man that married, and the endless lawfuits that they gave rife to, have at length induced the chiefs, to concur in their being, as far as possible, laid aside; adopting in lieu of them, the semundo malayo, or maredeeko; which they now strongly recommend to their dependants, as free from the incumbrances of the other modes, and tending, by facilitating marriage, and the confequent increase of population, to promote the welfare of their country. Unwilling however to abolish arbitrarily a favorite custom of their anceftors, marriage by joojoor is still permitted to take place, but under fuch restrictions as will, it is hoped, effectually counteract it's hitherto pernicious confequences. Marriage by ambel ana, which rendered a man and his descendants the property of the family he married into, is now prohibited, and none permitted for the future, but by semundo, or joojour subject to the following regulations.
- "The joojoor of a virgin (gaddees) has been hitherto one hundred and twenty dollars: the addat annexed to it, tool is tangeel, fifteen dollars; ocpa daoun codo, fix dollars, and tallee koolo, five dollars:
- "The jeojoor of a widow, eighty dollars, without the addat; unless her children by the former marriage went with her, in which case the joojoor gaddees was paid in full.
- "It is now determined that on a man's giving his daughter in marriage, by joojoor, for the future, there shall in lieu of the above, be fixed a fum not exceeding one hundred and fifty dollars, to be in full for joojoor and all addat whatever. That this fum shall, when the marriage takes place, be paid upon the fpot; that if credit is given for the whole or any part, it shall not be recoverable by course of law; and as the fum includes the tallee koolo, or bond of relation. ship, the wife thereby becomes the absolute property of the husband. The marriage by joojoor being thus rendered equivalent to actual

ing Marriage.

fale, and the difficulty enhanced by the necessity of paying the full price upon the spot, it is probable that the custom will in a great measure cease, and though not positively, be virtually abolished. Nor can a lawfuit follow from any future joojoor.

- "The addat, or custom, of the semundo malayo or maredeeko, to be paid by the husband to the wife's family upon the marriage taking place, is fixed at twenty dollars and a buffaloe, for such as can afford it; and at ten dollars and a goat, for the poorer class of people.
- "Whatever may be acquired by either party during the substitute of the marriage, becomes joint property, and they are jointly liable to debts incurred, if by mutual consent. Should either contract debts without the knowledge and consent of the other, the party that contracts, must alone bear them, in case of a divorce.
- "If either party infift, or both agree in it, a divorce must follow. No other power can separate them. The effects, debts, and credits in all cases to be equally divided. If the man infifts upon the divorce, he pays a charro of twenty dollars to the wise's family, if he obtained her a virgin; if a widow, ten dollars. If the woman infifts on the divorce, no charro is to be paid. If both agree in it, the man pays half the charro.
- " If a man married by femundo dies-Vide " Inheritance."
- "If a man carries off a woman with her consent, and is willing either to pay her price at once by joojoor, or marry her by femundo, as the father or relations please, they cannot reclaim the woman, and the marriage takes place.
- "If a man carries off a girl under age (which is determined by her not having her ears bored, and teeth filed—booloom betenday, bedabong) though with her own confent, he pays, exclusive of the addat joojoor, or femundo, twenty dollars, if she be the daughter of a pambarab; and ten dollars for the daughter of any other, whether the marriage takes place or not.

- "If a refow, or person without property and character, carries off a woman (though with her own consent) and can neither pay the joojoor, nor addat semundo, the marriage shall not take place, but the man be fined five dollars and a goat for misdemeanor. If she be under age, his fine ten dollars and a goat.
- "If a man has but one daughter, whom to keep her near him, he wishes to give in marriage by femundo; should a man carry her off, he shall not be allowed to keep her by joojoor, though he offer the money upon the spot. If he refuses to marry her by femundo, no marriage takes place, and he incurs a fine to the father of ten dollars and a goat.
- "If a man carries off a woman under pretence of marriage, he must lodge her immediately with some reputable family. If he carries her essewhere, for a single night, he incurs a fine of fifty dollars, payable to her parents or relations.
- "If a man carries off a virgin against her inclination (me-oolee) he incurs a fine of twenty dollars and a buffaloe: if a widow, ten dollars and a goat, and the marriage does not take place. If he commits a rape, and the parents do not chuse to give her to him in marriage; he incurs a fine of twenty dollars.
- The addat seebaye, or custom of giving one woman in exchange for another taken in marriage; a modification of the joojoer; is still admitted off; but if the one be not deemed an equivalent for the other, the necessary compensation (as the pangalappang, for nonage) must be paid upon the spot, or it is not recoverable by course of law. If a virgin is carried off (te-larree geddees) and another is given in exchange for her, by addat seebaye, twelve dollars must be paid with the latter, as addat ka sala.
- "A man married by ambel ana, may redeem himself and family, on payment of the joojoor and addat of a virgin beforementioned.
- "The charro of a joojeer marriage is twenty five dollars. If the joajeer be not yet paid in full, and the man infifts on a divorce, he receives

- back what he has paid, less twenty five dollars. If the woman infifts, no charro can be claimed by her relations. If the tallee kooloo is pootoos (broken) the wife is the husband's property, and he may fell her if he pleases, remains all tags a long stallob avil bond
- If a man compells a female debtor of his to cohabit with him, her debt, if the fact be proved, is thereby discharged, if forty dollars and upwards: if under forty, the debt is clear, and he pays the difference.

 If she accuses her master, falsely, of this offence, her debt is doubled.

 If he cohabits with her by her confent, her parents may compell him to marry her, either by joojoor, or semundo, as they please.
- fact is proved, must marry her; and they pay to the proatteens a joint fine of twenty dollars and a buffaloe. This fine, if the parties agree to it, may be levied in the country by the neighbouring proatteens (without bringing it before the regular court.)
- If a woman proves with child by a relation within the prohibited degrees, they pay to the proatteens a joint fine of twice fifty dollars, and two buffaloes; (bootum duo aucoop).
- "A marriage must not take place between relations, within the third degree, or toongal nanay. But there are exceptions for the descendants of semales, who passing into other families become as strangers. Of two brothers, the children may not intermarry. A sister's son may marry a brother's daughter; but a brother's son may not marry a sister's daughter.
- "If relations within the prohibited degrees intermarry, they incur a fine of twice fifty dollars and two buffaloes, and the marriage is not valid-
- On the death of a man married by joojoor or purchase, any of his brothers; the eldest in preference, if he pleases; may succeed to his bed. If no brother chuses it, they may give the woman in marriage to any relation on the father's side, without addat; the person who marries her replacing the deceased (mangaballoo). If no relation takes her

- her, and she is given in marriage to a stranger, he may either be adopted into the family, to replace the deceased; without addat; or he may pay her joojoor, or take her by semundo, as her relations please.
- If a person lies with a man's wife, by force, he is deserving of death, but may redeem his head by payment of the bangoon, eighty dollars. to be divided between the hufband and proatteens.
- "If a man furprizes his wife in the act of adultery, he may put both man and woman to death upon the fpot, without being liable to any bangoon. If he kills the man and spares his wife, he must redeem her life, by payment of fifty dollars to the proatteens. If the hufband fpares the offender, or has only information of the fact from other persons, he may not afterwards kill him, but has his remedy at law, the fine for adultery being fifty dollars, to be divided between the husband and the proatteens. If he divorces his wife on this account, he pays no charro.
- "If a younger fifter be first married, the husband pays fix dollars, addat pelalloo, for paffing over the elder.

"GAMING.

All gaming, except cock-fighting at stated periods, is absolutely pro- Lawrespecting hibited. The fine for each offence is fifty dollars. The person in gaming. whose house it is carried on, if with his knowledge, is equally liable to the fine, with the gamesters. A proatteen knowing of gaming in his doofoon, and concealing it, incurs a fine of twenty dollars. One half of the fines go to the informer; the other to the Company, to be distributed among the industrious planters, at the yearly payment of the customs.

"OPIUM FARM.

The fine for retailing of opium by any other than the farmer, is fifty Opium. dollars for each offence: one half to the farmer, and the other to the informer.

and dollars.

Remarks on, and elucidation of the various laws and customs - Modes of Pleading-Nature of Evidence-Oaths-Inheritance-Outlawry-Theft-Murder, and compensation for it-Account of a Feud-Debts-Slavery.

THE foregoing system of the addat, or customs of the country, being Remarks on digested for the use of the natives, or of persons well acquainted with the foregoing their manners in general, and being defigned, not for an illustration of the customs, but fimply as a standard of right, the fewest and concifest terms possible have been made use of, and many parts must neceffarily be obscure to the bulk of readers. I shall therefore revert to those particulars that may require explanation, and endeavor to throw a light upon the spirit and operation of such of their laws especially, as feem most to clash with our ideas of distributive justice. This comment is the more requifite, as it appears that fome of their regulations, which were judged to be inconfiftent with the prosperity of the people, were altered and amended, through the more enlightened reason of the gentleman who acted as the representative of the English company. I must endeayour to recall the idea of the original institutions.

The plaintiff and defendant usually plead their own cause, but if circumstances render them unequal to it, they are allowed to pinjam mooloot, (borrow a mouth). Their advocate may be a proatteen, or any other person indifferently, nor is there any stated compensation for the affistance, though, if the cause be gained, a gratuity is generally given, and too apt to be rapaciously exacted by the proatteens from their clients, when their conduct is not attentively watched. The proatteen also who is fecurity for the damages, receives privately some confideration; but none is openly allowed of.

sature of an oath among them differ from

Mode of plead-

Evidence is used among these people in a manner very different from Evidence. the forms of our courts of justice. They never admit it on both fides of

the question; nor does the witness first make a general oath to speak the truth, and nothing but the truth. When a fact is to be established, either on the part of the plantiff, or of the defendant, he is asked if he can produce any evidence to the truth of what he afferts. On answering in the affirmative, he is directed to mention the person. This witness must not be a relation, a party concerned, nor even belonging to the fame doofoon. He must be a responsible man, having a family and a determinate place of refidence. Thus qualified, his evidence may be admitted. The fact to be proved is mentioned to him before he is fworn. If he confirms the affertion, it remains for him and the party concerned, to make outh to the truth of it; and thus the fact is established. They have a fettled rule in respect to the party that is to give in evidence. For inflance: A, fues B, for a debt: B, denies the debt: A is now to bring evidence to the debt, or on failure thereof, it remains with B. to clear himself of the debt, by swearing himself not indebted. Had B. acknowledged that fuch a debt had formerly fubfifted, but was fince paid, it would be incumbent on B. to prove the payment by evidence, or on failure it would rest with A. to confirm the debt's being still due, by his oath. This is an invariable mode, observed in all cases of property. man who acted as the representative of the English company,

As their manner of giving evidence differs from ours, so also does the nature of an oath among them differ from our idea of it. In many cases it is requisite that they should swear to what it is not possible, in the nature of things, they should know to be true. A. sues B. for a debt due from the father or grandfather of B. to the father or grandfather of A. The original parties are dead, and no witness of the transaction survives. How is the matter to be decided? It remains with B. to make oath, that his father or grandfather never was indebted to A's; or that if he was indebted, the debt had been paid. This, among us, would be esteemed a very strange method of deciding causes; but among these people, something of the kind is absolutely necessary. As they have no fort of written accounts, nor any thing like records or registers among them, it would be utterly impossible, for the plaintiff to establish the debt, by a positive proof, in a multitude of cases; and was the suit

to be difiniffed at once, as with us, for want of fuch proof, numbers of innocent persons would lose the debts really due to them, through the knavery of the persons indebted, who would scarce ever fail to deny a debt. On the fide of the defendant again; if he was not permitted to clear himfelf of the debt by oath; but that it refted with the plaintiff. only, to establish the fact by his fingle oath; there would be a fet of unprincipled fellows daily fwearing debts against persons who never were indebted to any of their generation. In fuch fuits; and there are many of them; it requires no small discernment to discover, by the attendant circumstances, where the truth lies; but this may be done, in most instances, by a person who is used to their manners, and has a personal knowledge of the parties concerned. But what they mean by their oath, in those cases, where it is impossible they should be acquainted with the facts they defign to prove, is no more than this; that they are fo convinced of the truth of the matter, as to be willing to fubject themfelves to the pajoo sompab (destructive consequences of perjury), if what they affert is believed by them to be false. The form of words used, is nearly as follows. " If what I now declare, namely" (here the fact is recited) " is truly and really fo, may I be freed and clear from my oath: if what I affert is wittingly false, may my oath be the cause of my destruction." But it may easily be supposed, that where the punishment for a false oath, rests altogether with the invisible powers, where no direct infamy, no corporal punishment is annexed to the perjury, there cannot be wanting many, who would maccan focmpab (fwallow an oath). and willingly incur the pajoo, in order to acquire a little of their neighbour's cash.

Although an oath, as being an appeal to the superior powers, is suppo- Oaths. fed to come within their cognizance alone, and that it is contrary to the spirit of their customs, to punish by human means, a perjury, even if it were clearly detected; yet so far prevalent is the opinion of their interposition in human affairs, that it is very seldom any man of substance, or who has a family that he fears may fuffer by it, will venture to foreone have concerned in the cardaction. I recolled an inferior

them in this notion. Any accident that happens to a man, who has been known to take a false oath, or to his children or grand children, is carefully recorded in memory, and attributed to this sole cause. Dupatty Goonong Ceylong and his family, have afforded an instance that is often quoted among the Rejangs, and has evidently had great weight. It was notorious, that he had about the year 1770, taken, in the most solemn manner, a salse oath. He had at that time five sons grown up to manhood. One of them, soon after, in a scusse with some bugguesses (country soldiers) was wounded, and died. The Dupatty, the next year, lost his life in the issue of a disturbance he had raised in the district. Two of the sons died afterwards, within a week of each other. Mas Caddah, the fourth, is blind; and Treman, the fifth, lame. All this is attributed to, and sirmly believed to be the consequence of the father's perjury.

Collateral Oaths.

In administering an oath, if the matter litigated respects the property of the grandsather, all the collateral branches of the family descended from him, are understood to be included in its operation: if the father's effects only are concerned, or the transaction happened in his life time, his descendants are included: if the affair regards only the present parties, and originated with them, they and their immediate descendants only, are-comprehended in the consequences of the oath. These oaths they accordingly call soempab seping addo naynay, or seping addo bapa; and if any single one of these descendants result to join in the oath, it vitiates the whole; that is, it has the same effect, as if the party himself resulted to swear: a case that not unfrequently occurs. It may be observed that the spirit of this custom, tends to the requiring a weight of evidence, and an increase of the importance of the oath, in proportion as the distance of time renders the fact to be established, less capable of proof in the ordinary way.

Sometimes the difficulty of the case alone, will induce the court to insist on administering the oath to the relations of the parties, although they are no ways concerned in the transaction. I recollect an instance

where

where three people were profecuted for a theft. There was no positive proof against them, yet the circumstances were so strong, that it appeared proper to put them to the test of one of these collateral oaths. They were all willing, and two of them fwore. When it came to the turn of the third, he could not perfuade his relations to join with him, and he was accordingly brought in for the whole amount of the goods stolen, and penalties annexed. Tow to much add become

govern of Some n-lame has by him certain of

These customs bear a strong resemblance to the rules of proof established among our ancestors the Anglo Saxons, who were likewise obliged, in the case of oaths taken for the purpose of exculpation, to produce a certain number of compurgators; but as these might be any indifferent persons, who would take upon them to bear testimony to the truth of what their neighbour fwore, from an opinion of his veracity. there feems to be more refinement, and more knowledge of human nature in the Sumatran practice. The idea of devoting to destruction, by a wilful perjury, not himself only, but all, even the remotest branches of a family which constitutes his greatest pride, and of which the deceased heads are regarded with the veneration that was paid to the dii lares of the ancients, has doubtless restrained many a man from taking a false oath, who, without much compunction, would suffer thirty or an hundred compurgators of the former description, to take their chance of that fate. Their strongest prejudices are here converted to the most beneficial purpofes.

The place of greatest solemnity for administering an oath, is the Ceremony of crammat or burying ground of their ancestors; and several superstitious ceremonies are observed on the occasion. The people near the sea coast in general, by long intercourse with the Malays, have an idea of the Koraan, and usually employ this in swearing, which the priests do not fail to make them pay for; but the inland people keep, laid up in their houses, certain old reliques, called in Rejang, pelakko, and in Paffummah, factean, which they produce when an oath is to be taken. The person who has lost his cause, and with whom it commonly lies to bind

taking an oath.

Fff

his adversary by an oath, often defires two or three days time, to get ready his swearing apparatus (sompatan). Some of these are looked upon as more facred, and of greater efficacy than others. They confift of an old rufty creefe, a broken gun barrel, or any ancient trumpery, to which chance or caprice has annexed an idea of extraordinary virtue. These they generally dip in water, which the person who swears, drinks off, after having pronounced the form of words before mentioned. The pangeran of Soongey-lamo has by him certain copper bullets, which had been steeped in water, drunk by the Soongey etam chiefs, when they bound themselves never to molest his districts: which they have only done fince, as often as they could venture it with fafety, from the relaxation of our government. But these were political oaths. The most ordinary foompatan is a creefe, and on the blade of this, they fometimes drop lime juice, which occasions a stain on the lips of the person performing the ceremony; a circumstance that may not improbably be supposed to make an impression on a weak and guilty mind. Such would fancy that the external stain conveyed to the beholders, an image of the internal. At Manna the Soompatan most respected is a gun barrel. When produced to be fworn on, it is carried to the spot in state, under an umbrella, and wrapt in filk. This parade has an advantageous effect, by influencing the mind of the party, with an high idea of the importance and folemnity of the bufiness. In England, the familiarity of the object, and the fummary method of administering oaths, are well known to diminish from their weight, and to render them, too often nugatory. They fometimes fwear by the earth, laying their hands upon it, and wishing that it may never produce aught for their nourishment, if they speak falsely. In all these ceremonies, they burn on the spot, a little gum benjamin; " Et acerra thuris plena, possitusque carbo in cespite vivo."

It is a striking circumstance, that practices which boast so little of reason in their foundation; which are in fact so whimsical and childish;

should

^{*} The form of taking an oath among the people of Madagafcar, very nearly resembles the ceremonies used by the Sumatrans. There is a strong similarity in the articles they swear on, and in the circumstance of their drinking the consecrated water.

should yet be common to nations, the most remote in situation, climate. language, complexion, character, and every thing that can diffinguish one race of people from another. Formed of like materials, and furnished with like original fentiments, the uncivilized tribes of Europe and of India, trembled from the fame apprehenfions, excited by fimilar ideas, at a time when they were ignorant, or even denied the possibility of each others existence. Mutual wrong, and animosity, attended with disputes and accusations, are not by nature confined to either description of people. Each, in doubtful litigations, might feek to prove their innocence, by braving, on the justice of their cause, those objects which infpired amongst their countrymen, the greatest terror. The Sumatran impressed with an idea of invisible powers, but not of his own immortality, regards with awe the supposed instruments of their agency, and fwears on creefes, bullets and gun barrels; weapons of perfonal deftruction. The German Christian of the seventh century, more indifferent to the perils of this life, but not less superstitious, swore on bits of rotten wood, and rufty nails, which he was taught to revere, as poffeffing efficacy to fecure him from eternal perdition.

When a man dies, his effects, in common course, descend to his male Inheritance. children in equal shares; but if one among them is remarkable for his abilites above the reft, though not the eldeft, he usually obtains the largest porportion, and becomes the head of the toongovan or house; the others voluntarily yielding him the superiority. A pangeran of Manna left feveral children: none of them succeeded to the title, but a name of distinction was given to one of the younger, who was looked upon as chief of the family, after the father's decease. Upon asking the eldest, how it happened that the name of distinction passed over him, and was conferred on his younger brother, he answered with great naiveté, " because I am accounted weak and filly." If no male childern are left, and a daughter only remains, they contrive to get her married by the mode of ambel ana, and thus the toongooan of the father continues. An equal distribution of property among children is more natural, and conformable to justice, than vesting the whole in the eldest son, as prevails throughout

throughout most part of Europe; but where wealth consists in landed estate, the latter mode, befide favoring the pride of family, is attended with fewest inconveniencies. The property of the Sumatrans being personal merely, this reason does not operate with them. Land is so abundant in proportion to the population, that they fearcely confider it as the subject of right, any more than the elements of air and water; excepting fo far as in speculation, the prince lays claim to the whole. The ground however, on which a man plants or builds, with the confent of his neighbours, becomes a species of nominal property, and is transferable; but as it costs him nothing, beside his labor, it is only the produce which is esteemed of value, and the compensation he receives is for this alone. A temporary usufruct is accordingly all that they attend to, and the price, in case of sale, is generally ascertained by the coconut, doorean. and other fruit trees, that have been planted on it; the buildings being for the most part but little durable. Whilst any of those subsist, the descendants of the planter may claim the ground, though it has been for years abandoned. If they are cut down he may recover damages, but if they have disappeared in the course of nature, the land reverts to the public.

They have a custom of keeping by them a sum of money, as a refource against extremity of distress, and which common exigencies do not call forth. This is a refined antidote against despair, because, whilst it remains possible to avoid encroaching on that treasure, their affairs are not at the worst, and the idea of the little hoard serves to buoy up their spirits, and encourage them to struggle with wretchedness. It usually therefore continues inviolate, and descends to the heir, or is lost to him by the sudden exit of the parent. From their apprehension of dishonesty, and insecurity of their houses, their money is for the most part concealed in the ground, the cavity of an old beam, or other secret place, and a man, on his death bed, has commonly some important discovery of this nature to make to his assembled relations.

to justice, then vehing the whole in the deed tory

The practice of outlawing (leppay je scoray) an individual of a family Outlawing by the head of it, has it's foundation in the custom which obliges all the branches to be responsible for the debts contracted by any one of the kindred. When an extravagant and unprincipled spendthrift is running a career that appears likely to involve his family in ruinous confequences. they have the right of diffolving the connexion, and clearing themselves of further responsibility, by this public act, which, as the writ expresses it, fends forth the out cast, as a deer into the woods, no longer to be confidered as enjoying the priviledges of fociety. This character is what they term reefow, though it is fometimes applied to perfons not

absolutely outlawed, but of debauched and irregular manners.

In the Saxon laws we find a strong resemblence to this custom; the kindred of a murderer being exempt from the feud, if they abandoned him to his fate. They bound themselves in this case neither to converse with him, or to furnish him with meat or other necessaries. This is precifely the Sumatran outlawry, in which it is always particulary specified (beside what relates to common debts) that if the outlaw kills a person, they will not pay the compensation, nor claim it, if he is killed. But the writ must have been iffued before the event, and they cannot free themselves by a subsequent process, as it would seem the Saxons might. If an outlaw commits murder, the friends of the deceased may take personal revenge on him, and are not liable to be called to an ac. count for it; but if fuch be killed, otherwise than in satisfaction for murder, although his family have no claim, the prince of the country is entitled to a certain compensation, all outlaws being nominally his property, like other wild animals. An bloom bedient ethal bas

In cases of thest, the swearing a robbery against a person suspected, is of Proof in cases no effect, and juftly, for were it otherwise, nothing would be more common than the profecution of innocent perfons. The proper proofs are either, feizure of the person in the fact, before witnesses, or discovery of the goods stolen, in possession of one who can give no satisfactory account how he came by them. As it frequently happens that a man finds part

Ggg

little

only

only of what he had loft, it remains with him, when the robbery is proved, to afcertain the whole amount, by oath, which in that point is held fufficient.

Compensation for Murder.

It feems strange to those who are accustomed to the severity of penal laws, according to which the punishment mostly exceeds by many degrees the offence, how a fociety can exist, in which the greatest of all crimes is, agreeably to established custom, expiated by the payment of a certain fum of money; a fum not proportioned to the rank and ability of the murderer, nor to the premeditation, or other aggravating circumstances of the fact, but regulated only by the quality of the person murdered. The practice had doubtless its source in the imbecility of government, which being unable to enforce the law of retaliation; the most obvious rule of punishment; had recourse to a milder scheme of retribution, as being preferable to abfolute indemnity. The latter it was competent to carry into execution, because the guilty persons readily fubmit to a penalty, which effectually relieves them from the burthen of anxiety for the confequences of their action. Instances occur in the history of all states, particularly those which suffer from internal weakness, of iniquities going unpunished, owing to the rigor of the pains denounced against them by the laws, which defeats its own purpose. The original mode of avenging a murder, was probably by the arm of the person nearest in consanguinity, or friendship, to the deceased; but this was evidently destructive of the public tranquility, because that the wrong became progressive, each act of satisfaction, or justice as it was called, being the fource of a new revenge, till the feud became general in the community; and fome method would naturally be fuggested to put a stop to such confusion. The most direct step is to vest in the magistrate or the law, the rights of the injured party, and to arm them with a vindictive power; which principle, the policy of more civilized focieties has refined to that of making examples in terrorem, with a view of preventing future, not of revenging past crimes. But this requires a sirmness of authority to which the Sumatran governments are strangers. They are without coercive power, and the submission of the people, is little

take

little other than voluntary; especially of the men of influence, who are held in subjection rather by the sense of general utility, planted in the breasts of mankind; attachment to their family and connexions; and veneration for the spot in which their ancestors were interred, than by the apprehension of any superior authority. These considerations, however, they would readily forego, renounce their fealty, and quit their country, if in any case they were in danger of paying with life, the forseit of their crimes: to lesser punishments those ties induce them to submit; and to strengthen this hold, their customs wisely enjoin, that every the remotest branch of the family, shall be responsible for the payment of their judgement, and other debts; and in cases of murder, the bangoon, or compensation, may be levied on the inhabitants of the village the culprit belonged to, if it happen that neither he, nor any of his relations can be found.

The equality of punishment, which allows to the rich man the faculty of committing, with small inconvenience, crimes that bring utter deftruction on the poor man, and his family, and which is in fact the greatest inequality, originates certainly from the interested defign of those through whose influence the regulation came to be adopted. It's view was to establish a subordination of persons. In Europe, the absolute distinction between rich and poor, though too fenfibly felt, is not infifted upon in speculation, but rather denied or explained away in general reasoning. Among the Sumatrans it is coolly acknowledged, and a man without property, family, or connexions, never, in the partiality of felf-love. confiders his own life as being of equal value with that of a man of fubstance. A maxim, though not the practice, of their law, fays, that he who is able to pay the bangoon for murder, must fatisfy the relations of the deceased; he who is unable, must suffer death." But the avarice of the relations prefers felling the body of the delinquent for what his flavery will fetch them, to the fatisfaction of feeing the murder revenged by the public execution of a culprit of that mean defcription. Capital punishments are therefore almost totally out of use among them; and it is only par la loi du plus fort, that the Europeans

take the liberty of hanging a notorious criminal, now and then; whom, however, their own chiefs always condemn, and formally fentence.

Corporal pu-

Corporal punishment of any kind, is rare. The chain, and a fort of stocks, made of the penang tree, are adopted from us; the word paffoong," now commonly used to denote the latter, originally fignifying, and being still frequently applied to confinement in general. A kind of cage made use of in the country, is probably their own invention. "How do you fecure a prisoner, (a man was asked) without employing a chain or our flocks?" "We pen him up, faid he, as we would a bear." The cage is made of bomboos laid horizontally, in a fquare, piled alternately, fecured by timbers at the corners, and ftrongly covered in at top. To lead a runaway, they fasten a rattan round his neck, and pass it through a bamboo somewhat longer than his arms, which are made fast to it at their full extent. If the offender is of a defperate character, they bind him hands and feet, and fling him on a pole. When they would convey a person, from accident or otherwise unable to walk, they make a palanquin by splitting a large bamboo near the middle of its length, where they contrive to keep it open, fo that the cavity forms a bed; the ends being preferved whole, to rest upon their shoulders.

The custom of exacting the bangoon for murder, seems only designed with a view of making a compensation to the injured family, and not of punishing the offender. The word signifies "awaking" or "raising up," and the deceased is supposed to be replaced, or raised again to his samily, in the payment of a sum proportioned to his rank, or equivalent to his or her personal value. The price of a semale slave is generally more than that of a male, and therefore, I heard a chief say, is the bangoon of a woman more than that of a man. It is upon this principle that their laws take no cognizance of the distinction between a wilful murder, and what we term manslaughter. The loss is the same to the samily and therefore the compensations are alike. A dupatty of Laye, in an ill hour, stept unwarily across the mouth of a cannon, at the instant

it was firing for a falute, and was killed by the explosion; upon which his relations immediately sued the serjeant of the country guard, who applied the match, for the recovery of the bangoon; but they were cast, and upon these grounds; that the dupatty was instrumental in his own death; and that the Company's servants being amenable to other laws for their crimes, were not, by established custom, subject to the bangoon, or other penalties inslicted by the native chiefs, for accidents resulting from the execution of their duty. The tippong boomee, expiation, or purisheation of the earth from the stain it has received, was however gratuitously paid. No plea was set up, that the action was unpremeditated, and the event chance medley.

The amount of the bangeon, in the countries southward of Rejang, is fixt at eighty eight dollars and eight fanams; and the tippong boomee, called there bassing loora, is twenty eight dollars; beside sinding a buffaloe and rice. There is also the palantan or been, of sourteen dollars, paid both by the prosecutor and prosecuted, where there have been killed or wounded on both sides: but if a man kills another who makes no resistance, the whole palantan, or twenty-eight dollars, is paid by the murderer.

The introduction of this custom is beyond the extent of Sumatrantradition, and has no connexion with, or dependance on Mahometanism, being established amongst the most inland people from time immemorial. In early ages it was by no means confined to that part of the world. The bangoon is perfectly the same as the compensation for murder, in the rude institutions of our Saxon ancestors, and other northern nations. It is the eric of Ireland, and the aponai of the Greeks. In the compartments of the shrield of Achilles, Homer describes the adjudgement of a fine for homicide. It would seem then to be a natural step in the advances from anarchy to settled government, and can only take place in such so cieties as have already a strong idea of the value of personal property, esteeming it's possession of the next importance to that of life, and plath h

cing it in competition with the ftrongest passion that seizes the human in country suards the series of the country suards in the series of the country suards.

applied the match, for the recovery of the bangoon; but they were earl,

The compensation is so regularly established among the Sumatrans, that any other fatisfaction is feldom demanded. In the first heat of refentment, retaliation is fometimes attempted, but the spirit soon evaporates, and application is usually made, upon the immediate discovery of the fact, to the chiefs of the country, for the exertion of their influence, to oblige the criminal to pay the bangoon. His death is then not thought of, unless he is unable, and his family unwilling, to raise the established fum. Inftances, it is true, occur, in which the profecutor knowing the European law in fuch case, will, from motives of revenge, urge to the Refident the propriety of executing the offender, rather than receive the bangoon; but if the latter is ready to pay it, it is contrary to their laws to proceed further. The degree of fatisfaction that attends the payment of the bangoon, is generally confidered as absolute to the parties concerned: they receive it as full compensation, and pretend to no farther claim upon the murderer and his family. Slight provocations however have been fometimes known to renew the feud, and there are not wanting inflances of a fon's revenging his father's murder, and willingly refunding the bangoon. When, in an affray, there happen to be feveral persons killed on both sides, the business of justice is only to state the reciprocal losses, in the form of an account current, and order the balance to be discharged, if the numbers be unequal. The following is a relation of the circumstances of one of those bloody feuds, which happened whilft I was on the ifland; but which become every year more rare, where our influence extends.

Account of a feud.

Raddeen Seeban was the head of a tribe in the district of Manna, of which Pangeran, Rajab Calippah was the Calippah or official chief; though by the customs of the country he had no right of fovereignty over him. The Pangeran not allowing him an adequate share of sines, and other advantages annexed to his rank, was the foundation of a jealoufy and illwill between them, which an event that happened a few

years fince, raised to the highest pitch of family feud. Lessot, a younger brother of the Pangeran, had a wife who was very handsome, and whom Raddeen Seeban had endeavored to procure, whilst a virgin, for bis younger brother, who was in love with her: but the pangeran had found means to circumvent him, and obtained the girl for Leffoot. However, it feems the lady herfelf had conceived a violent liking for the brother of Raddeen Seeban, who found means to enjoy her after the was married, or was violently suspected so to have done. The consequence was, that Lessot killed him, to revenge the dishonor of his bed. Upon this the families were presently up in arms, but the English Resident interfering, preserved the peace of the country, and fettled the affair agreeably to the customs of the place, by bangoon and fine. But this did not prove fufficient to extinguish the fury which raged in the hearts of Raddeen Seeban's family. whose relation was murdered. It only ferved to delay their revenge, 'till a proper opportunity offered of gratifying it. The people of the country being called together on a particular occasion, the two inimical families were affembled, at the fame time, in Manna bazar. Two younger brothers (they had been five in all) of Raddeen Seeban, going to the cockpit, faw Raja Moodo, the next brother of the pangeran, and Leffoot his younger brother, in the open part of a house which they passed. They quickly returned, drew their creefes, and attacked the pangaran's brothers, calling to them, " if they were men to defend themselves." The challenge was instantly accepted. Leffoot, the unfortunate husband, fell, but the aggreffors were both killed by Raja Moodo, who was himfelf much wounded. The affair was almost over before the scuffle was perceived. The bodies were lying on the ground, and Raja Moodo was supporting himself against a tree which stood near the spot, when Raddeen Seeban, who was in a house on the opposite side of the bazar at the time the affray happened, being made acquainted with the circumstances, came over the way, with his lance in his hand. He passed on the contrary side of the tree, and did not see Raja Moodo, but began to stab with his weapon the dead body of Leffoot, in excess of rage, on feeing the bloody remains of his two brothers. Just then, Raja Moodo, who was half dead, but had his creese in his hand, still unseen by Raddeen Seeban, crawled a step or two and fluck fluck the creese into his side, saying "Mattee caow"—" die wretch"! Raddeen Seeban spoke not a word, but put his hand on the wound, and walked across to the house from whence he came, at the door of which he dropped down, and expired. Such was the catastrophe. Raja Mooda survived his wounds, but being much deformed by them, lives a melancholy example of the effects of these barbarous seuds.

Law refpecting debts. The law which renders all the members of a family reciprocally bound for the fecurity of each others debts, forms a strong connexion among them, and occasions the elder branches to be particularly watchful of the conduct of those, for whose imprudence they must be answerable.

When a debtor is unable to pay what he owes, and has no relation or friends capable of doing it for him; or when the children of a deceased person do not find property enough to discharge the debts of their parent, they are forced to the state which is called mengeering: that is, they become a species of bondslaves to the creditor, who allows them subfistance, and cloathing, but does not appropriate the produce of their labor, to the diminution of their debt. Their condition is better than that of pure flavery, in this, that the creditor cannot strike them, and they can change their mafters, by prevailing on another person to pay their debt, and accept of their labor on the fame terms. Of course they may procure their liberty, if they can by any means provide a fum equal to their debt; whereas a flave, though possessing ever so large property, has not the right of purchasing his liberty. If however, the creditor shall demand formally the amount of his debt, from a person mengeering, at three feveral times, allowing a certain number of days between each demand, and the latter is not able to perfuade any one to redeem him, he becomes, by the custom of the country, a pure slave; upon the creditor's giving notice to the chief, of the transaction. This is the resource he has against the laziness or untoward behaviour of his debtor, who might, in the state of mengeering, be only a burthen to him. If the children of a deceased debtor are too young to be of service, the charge of their maintenance

tenance is added to the debt. This opens a door for many iniquitous practices, and it is in the rigorous, and frequently unjust exertion of these rights, which a creditor has over his debtor, that the chiefs are enabled to oppress the lower class of people, and which the English refidents find it necessary to be most watchful to restrain them from abusing.

When a man of one district or country, has a debt owing to him from the inhabitant of a neighbouring country, which he cannot recover payment of, an usual resource is to seize on one or more of his children, and carry them off; which they call andac. The daughter of a Rejang dupatty was carried off in this manner by the Labour people. Not hearing for fome time from her father, she fent him cuttings of her hair and nails, by which she intimated a resolution of destroying herself, if not soon released.

The right of flavery is established in Sumatra, as it is throughout the Slavery. east, and has been all over the world; yet but few instances occur of the country people actually having flaves, though they are common enough in the Malay, or fea port towns. Their domesticks and laborers are either dependant relations, or the orang mengeering above defcribed, who are emphatically styled debtors.* The simple manners of the people require that their fervants should live, in a great measure on a foot of equality with the rest of the family, which is inconfistent with the authority necessary to be maintained over flaves, who have no principle to restrain them but that of personal fear+, and know that their

^{*} The Malay terms, orang berootang, and orang mengeering, can only be rendered by the English word debtor; though they apply to persons in very different circumstances : the epithets of folvent, and infolvent, would give fome idea of the diffinction.

⁺ I do not mean to affert, that all men in the condition of flaves are devoid of principle: I have experienced the contrary, and found in them affection and first honefty: but that there does not refult from their fituation, as flaves, any principle of moral rectitude; whereas every other condition of fociety has annexed to it, ideas of duty and mutual obligation, arifing from a fense of general utility. That sublime species of morality derived from the injunctions of religion. it is almost univerfally their fate to be likewise strangers to; because slavery is found inconfistent with the spirit of the gospel, not merely as inculcating philanthropy, but inspiring a principle of equality amongst mankind.

civil condition cannot be alrered for the worfe. There is this advantage alfo, that when a debtor abfoonds, they have recourse to his relations for the amount of his debt, who, if unable to pay it, must mengeering in his room; whereas, when a flave makes his escape, the law can give no redrefs, and his value is loft to the owner. These people, moreover. are from habit, backward to strike, and the state of slavery unhappily requires the frequent infliction of punishment in that mode. A flave cannot poffess, independently, any property; yet it rarely happens that a master is found mean and fordid enough, to despoil them of the fruits of their industry; and their liberty is generally granted them, when in a condition to purchase it, though they cannot demand it of right. It is nothing uncommon for those belonging to the Europeans, to possess flaves of their own, and to acquire confiderable fubstance. Their condition is here. for the most part, less unhappy than that of persons in other situations of life. I am far from wishing to diminish from the horror that should ever accompany the general idea of this state, which I am convinced is not necessary among mankind; but I canno help remarking, as an extraordinary fact, that if there is one class of people eminently happy above all others upon earth, it is the body of Caffres, or negro flaves belonging to the India Company at Bencoolen. They are well clothed and fed, and supplied with a proper allowance of liquor; their work is by no means fevere; the persons appointed as their immediate overseers. are chosen, for their merit, from amongst themselves; they have no occasion of care or anxiety for the past or future, and are naturally of a lively and open temper. The contemplation of the effects which fuch advantages produce, must afford the highest gratification to a benevolent mind. They are feen perpetually laughing or finging, and fince the period they were first carried thither, from different parts of Africa and Madagascar, to the present hour, not so much as the rumor of disturbance, or discontent has ever been known to proceed from them. They hold the natives of the ifland in contempt, have a degree of antipathy towards them, and enjoy any mischief they can do them; and these in their turn regard the Coffres as devils half humanized.

The

The practice faid to prevail elsewhere, of men selling themselves for slaves, is repugnant to the ideas of the Sumatrans, as it seems to reason. It is an absurdity to barter any thing valuable, much more civil existence, for a sum which, by the very act of receiving, becomes again the property of the buyer. Yet, if a man runs in debt, without a prospect of paying, he does virtually the same thing, and this, in cases of distress, is not uncommon; in order to relieve perhaps a beloved wife, or favorite child, from similar bondage. A man has even been known to apply in considence to a friend, to sell him to a third person, concealing from the purchaser the nature of the transaction, till the money was appropriated.

Ignorant stragglers are often picked up in the country, by lawless knaves in power, and sold beyond the hills. These have sometimes procured their liberty again, and prosecuting their kidnappers, have recovered large damages. In the district of Allas, a custom prevails, by which, if a man has been sold to the hill people, however unfairly, he is restricted on his return, from affociating with his countrymen, as their equal, unless he brings with him a sum of money, and pays a fine for his re-enfranchisement, to his calippab or chief. This regulation has taken its rise from an idea of contamination, among the people, and from art and avarice among the chiefs,

or This part of the island is in a low state of population, but it is an error to asserbe this to the mode of obtaining wives by purchase. Motives for influencing the people to alter fome of their marriage customs.

By much the greater number of the legal disputes, among these people, have their fource in the intricacy attending their marriage contracts. In most uncivilized countries, these matters are very simple, the dictates of nature being obeyed, or the calls of appetite fatisfied, with little ceremony, or form of convention; but with the Sumatrans, the difficulties both precedent and fubfequent, are encreased to a degree unknown even in the most refined states. To remedy these inconveniences, which might be supposed to deter men from engaging in marriage, was the view of the Resident of Laye, beforementioned, who prevailed upon them to fimplify their engagements, as the means of preventing litigation between families, and of encreasing the population of the country. How far his liberal views will be answered, by having thus influenced the people to change their customs; whether they will not soon relapse into the ancient track; and whether, in fact, the cause that he supposes, did actually contribute to retard population, I shall not pretend to determine; but as the last is a point on which a difference of opinion prevails, I shall take the liberty of quoting here, the fentiments of another fervant of the Company, who poffeffes an understanding highly enlightened.*

Reasons against this alteration.

"This part of the island is in a low state of population, but it is an error to ascribe this to the mode of obtaining wives by purchase. The circumstance of children constituting part of the property of the parents, proves a most powerful incentive to matrimony, and there is not perhaps any country on the sace of the earth, where marriage is more general than here, instances of persons of either sex passing their lives in a state of celibacy, being extremely rare. The necessity of purchasing, does

not prove fuch an obstacle to matrimony as is supposed. Was it indeed true that every man was obliged to remain fingle, till he had accumulated, from the produce of his pepper garden, a fum adequate to the purchase of a wife, married pairs would truly be scarce. But the people have other refources; there are few families who are not in possession of some small substance; they breed goats and buffaloes, and in general keep in referve some small sum for particular purposes. The purchase money of the daughters ferves also to provide wives for the fons. Certain it is, that the fathers are rarely at a loss for money to procure them wives, fo foon as they become marriageable. In the diffricts under my charge are about eight thousand inhabitants, among whom, I do not conceive it would be possible to find ten instances of men of the age of thirty years unmarried. We must then seek for other causes of the paucity of inhabitants, and indeed they are fufficiently obvious; among these, we may reckon that the women are by nature unprolific, and cease gestation at an early age; that almost totally unskilled in the medical art, numbers fall victims to the endemic difeases of a climate, nearly as fatal to its indigenous inhabitants, as to the strangers who settle among them: to which we may add, that the indolence and inactivity of the natives, tend to relax and enervate the bodily frame, and to abridge the natural period of their lives."

The modes of marriage, according to the original institutions of these Modes of marpeople, are by joojoor, by ambel ana, or by semundo. The joojoor is a riage. certain fum of money, given by one man to another, as a confideration for the person of his daughter, whose situation, in this case, differs not much from that of a flave to the man she marries, and to his family. His absolute property in her depends however upon some nice circumstances. Befide the batang joojoor (or main fum), there are certain appendages or branches; one of which, the tallee koolo of five dollars, is usually, from motives of delicacy, or friendship, left unpaid, and so long as that is the case, a relationship is understood to subsist between the two families. and the parents of the woman have a right to interfere on occasions of iff treatment: the husband is also liable to be fined for wounding her; Kkk with

with other limitations of absolute right. When that sum is finally paid, which feldom happens but in cases of violent quarrel, the tallee koolo (tie of relationship) is said to be pootoose, (broken), and the woman becomes to all intents the flave of her lord. She has then no title to claim a divorce in any predicament; and he may fell her, making only the first offer to her relations. The other appendages, as already mentioned, are the toolis tangel, the derivation of which I cannot fatisfactorily trace; and the oopa daoun codo, which is a confideration for the expence of the marriage feast, paid to the girl's parent, who provides it. But sometimes it is deposited at the wedding, when a distribution is made of it amongst the old people present. The words allude to the leaf in which the rice is ferved up. These branches are seldom paid or claimed, before the batang (stem) is defrayed, of which a large proportion, as fifty, eighty, and fometimes an hundred and four dollars, is laid down at the time of marriage; and untill the first mentioned of these sums, at least, is produced, the man cannot take his wife home. In this case he commonly mengeering joojoor, continues a debtor with the family, till he can raife money fufficient to redeem himfelf; and after this, long credit is usually given for the remainder. Years often elapse, if the families continue on good terms, without the debt being demanded; particularly when an hundred and four dollars have been paid; unless distress obliges them to it. Sometimes it remains unadjusted to the second and third generation, and it is not uncommon to see a man suing for the joojoor of the fister of his grandfather. These debts constitute in fact the chief part of their subftance, and a person is esteemed rich who has several of them due to him, for his daughters, fifters, aunts, and great aunts. Debts of this nature are looked upon as facred, and are scarce ever lost. In Passummah, if the race of a man is extinct, and some of these remain unpaid, the doofoon or village to which the family belonged, must make it good to the creditor; but this is not infifted upon amongst the Rejangs.

In lieu of paying the joojoor, a barter transaction, called febaye, sometimes takes place, where one gaddees (virgin) is given in exchange for another; and it is not unusual to borrow a girl for this purpose, from a friend

friend or relation, the borrower binding himself to replace her, or pay her joojoor when required. A man who has a fon and daughter, gives the latter in exchange for a wife to the former. The person who receives her, disposes of her as his own child, or marries her himself. A brother will give his fifter in exchange for a wife, or in default of fuch, procure a coufin for the purpose. If the girl given in exchange be under age, a certain allowance per annum is made, till fhe becomes marriageable. Beguppoke is a mode of marriage differing a little from the common joojoor, and probably only taking place, where a parent wants to get off a child laboring under some defect. A certain sum is in this case fixed, below the usual custom, which, when paid, is in full for her value, without any appendages. In other cases likewise, the joojoor is sometimes leffened, and fometimes encreased, by mutual agreement; but on trials it is always estimated at an hundred and twenty dollars. If a wife dies foon after marriage, or at any time without children, the full joojoor cannot be claimed; it is reduced to eighty dollars; but should more than that have been laid down in the interim, there is no refunding. The joojoor of a widow, which is generally eighty dollars, without appendages, is again reduced upon a third marriage, allowance being made for delapidation. A widow, being with child, cannot marry again till fhe is delivered, without incurring a penalty. In divorces it is the fame. If there be no appearance of pregnancy, the must yet abstain from making another choice, during the period of three months and ten days.

When the relations and friends of the man go in form to the parents of the girl, to fettle the terms of the marriage, they pay at that time the addat besasla, or earnest, of fix dollars generally; and these kill a goat or a few sowls to entertain them. It is usually some space of time (except in cases of telarree gaddees, or elopement) after the payment of the besasla, before the wedding takes place; but, when the father has received that, he cannot give his daughter to any other person, without incurring a fine; which the young lady sometimes renders him liable to; for whilst the old folk are planning a match by patostan, or regular agreement between families, it frequently happens that Miss disappears with

with a more favored swain, and secures a match of her own choice. This practice, styled telarree gaddees, is not the least common way of determining a marriage, and from a spirit of indulgence and humanity, which sew codes can boast, has the sanction of the laws. The father has only the power left, of dictating the mode of marriage, but cannot take his daughter away, if the lover is willing to comply with the custom in such cases. The girl must be lodged, unviolated, in the house of some respectable samily, till the relations are advised of the enlevement, and settle the terms. If however, upon immediate pursuit, they are overtaken on the road, she may be forced back, but not after she has taken sanctuary.

By the Mosaic law, if a man left a widow, without children, his brother was to marry her. Among the Sumatrans, with or without children, the brother, or nearest male relation of the deceased, unmarried, (the father excepted) takes the widow. This is practised both by Malays and country people. The brother, in taking the widow to himself, becomes answerable for what may remain due of her purchase money, and in every respect represents the deceased. This is phrased guntee teecar, bantal nia—placing himself on his mat and pillow.

Chastity of the women.

Chastity prevails more perhaps among these than any other people. It is so materially the interest of the parents to preserve the virtue of their daughters unsullied; as they constitute the chief of their substance; that they are particularly watchful in this respect. But as marriages in general do not take place so early, as the forwardness of nature, in that climate, would admit, it will sometimes happen, notwithstanding their precaution, that a young woman not chusing to wait her father's pleasure, tastes the fruit by stealth. When this is discovered he can oblige the man to marry her, and pay the joojoor; or if he chuses to keep his daughter, the seducer must make good the difference he has occasioned in her value, and also pay the fine, called tippong boomee, for removing the stain from the earth. Prostitution for hire is, I think, unknown in the country, and confined to the more polite Malay bazars,

where

where there is usually a concourse of sailors and others, who have no honest settlement of their own, and are therefore upon the town. In thefe, vice generally reigns in a degree proportioned to the number and variety of people of different nations, who inhabit the place, or occasionally refort thither. From the scenes which these sea-ports present, travellers too commonly form their judgment, and imprudently take upon them to draw, for the information of the world, a picture of the manners of a people.

The different species of horrid and disgustful crimes, which are emphatically denominated, against nature, are unknown on Sumatra; nor have any of their languages terms to express such ideas.

Incest, or the intermarriage of persons within a certain degree of confanguinity; which is perhaps (at least after the first degree) rather an offence against the institutions of human prudence, than a natural crime; is forbidden by their customs, and punishable by fine: yet the guilt is often expiated by a ceremony, and the marriages, in many instances, confirmed.

Adultery is punishable by fine; but the crime is rare, and suits on the Adultery. fubject still less frequent. The husband, it is probable, either conceals his shame, or revenges it with his own hand.

If a man would divorce a wife he has married by joojoor, he may Divorces. claim back what he has paid in part, less twenty five dollars, the addat charro, for the damage he has done her; but if he has paid the joojoor in full, the relations may chuse whether they will receive her or not; if not, he may fell her. If a man has paid part of a joojoor, but cannot raise the remainder, though repeatedly dunned for it, the parents of the girl may obtain a divorce; but if it is not with the husband's concurrence, they lose the advantage of the charro, and must refund all they have received. A woman married by joojoor must bring with her, effects to the amount of ten dollars, or if not, it is deducted from the joojoor;

if she brings more, the husband is accountable for the difference. The original ceremony of divorce consists in cutting a rattan cane in two, in presence of the parties, their relations, and the chiefs of the country.

Second mode of marriage.

In the mode of marriage by ambel ana, the father of a virgin makes choice of some young man for her husband, generally from an inferior family, which renounces all further right to, or interest in him, and he is taken into the house of his father in law, who kills a buffaloe on the occasion, and receives twenty dollars from the son's relations. After this, the booroo bye 'nya (the good and bad of him) is vested in the wife's family. If he murders or robs, they pay the bangoon, or the fine. If he is murdered, they receive the bangoon. They are liable to any debts he may contract after marriage; those prior to it remaining with his parents. He lives in the family, in a state between that of a fon, and a debtor. He partakes as a fon of what the house affords, but has no property in himself. His rice plantation, the produce of his pepper garden, with every thing that he can gain or earn, belong to the family. He is liable to be divorced at their pleasure, and though he has children, must leave all, and return naked as he came. The family sometimes indulge him with leave to remove to a house of his own, and take his wife with him; but he, his children, and effects, are still their property. If he has not daughters by the marriage, he may redeem himself and wife, by paying her joojoor; but if there are daughters before they are emancipated, the difficulty is enhanced, because the family are equally entitled to their value. It is common, however, when they are upon good terms, to release him, on the payment of one joojoor, or at most with the addition of an addat of fifty dollars. With this addition, he may infift upon a release, whilst his daughters are not marriageable. If the family have paid any debts for him, he must also make them good. Should he contract more than they approve of, and they fear his adding to them, they procure a divorce, and fend him back to his parents; but must pay his debts, to that time. If he is a notorious spendthrift, they outlaw him. Instead of taking out a writ, they have only to prefent one to the proatteens and pambarab. This

is called booang fooray. They must banish him from home, and if they receive him again, or affift him with the smallest sum, they are liable to all his debts. On the prodigal fon's return, and promifes of amendment, this writ may be redeemed, on payment of five dollars to the proatteens, and farisfying the creditors. The writ of outlawry is inscribed on a piece of bamboo. This kind of marriage is productive of much confusion, for till the time it takes place, the young man belongs to one doofoon and family, and afterwards to another, and as they have no records to refer to, there is great uncertainty in fettling the time when debts were contracted, and the like. Sometimes the redemption of the family, and their return to the former doofoon, take place in the fecond or third generation; and in many cases it is doubtful whether they ever took place or not; the two parties contradicting each other, and perhaps no evidence to refer to. Hence arise various and intricate sudabos for him to liften to any other presented

Beside the modes of marriage above described, a third form, callay mode of led Semundo, has been adopted from the Malays, and thence termed marriage. semundo Malayo, or maredeeko (free). This marriage is a regular treaty between the parties, on the foot of equality. The addat paid the girls friends, has usually been twelve dollars. The agreement stipulates, that all effects, gains, or earnings, are to be equally the property of both, and in case of divorce by mutual consent, the stock, debts, and credits are to be equally divided. If the man only, infifts on the divorce, he gives the woman her half of the effects, and loses the twelve dollars he has paid. If the woman only, claims the divorce, she forfeits her right to the proportion of the effects, but is entitled to keep her teecar, bantal, and dundun (parapharnalia), and her relations are liable to pay back the twelve dollars; but it is feldom demanded. This mode, doubtless most conformable to our ideas of conjugal right and felicity, is that which the chiefs of the Rejang country have formally consented to establish throughout their jurisdiction, and to their orders, the influence of the Malay padres will contribute to give efficacy.

It will not be improper here to mark the customs of the people of Passummab, in regard to their marriage contracts, which though pervaded tive to marriage

Customs relaage in Paffumentirely by the same spirit, differ from those established amongst the Regangs, in several particulars.

The marriage by joojoor is there termed koolo. When the parties are determined in their regards, the father of the young man, or the boojong himself, goes to the house of the father of the woman, carrying with him forty, fifty dollars, or more. On opening his defign he tenders this money as a present, and the others acceptance of it is a token that he is inclined to forward the match. This is the bufiness of the first visit. The money thus deposited is called puggatan, and when the marriage is agreed upon, it is confidered as an equivalent for the drefs, and ornaments which the bride carries with her. It lies often in the hands of the girls father, three, fix, or twelve months, before the marriage is confummated. He fometimes fends for more, and is never refused; but it would be deemed scandalous for him to listen to any other proposals, whilst he thus continues dallam rassan (in treaty) with the former person. The purchase money confists of three distinct sums. The ooroop niaow (price of life), forty dollars; a creefe with a gold head and filver sheath, valued at ten dollars; and the foudo con billee, or pootoofe koolo (conclufion of the bargain), twenty dollars. These are generally made distinct payments.

The koolo marriage may be diffolved at the pleasure of either of the parties. If the woman infifts on separating, the children, if any, remain with the father. If the husband sues for the divorce, the children are divided. In these cases the purchase money is returned; an exact estimation is made of the value of the woman's trinkets, and what are not restored, must be made good by the husband. Sometimes a deduction is made from the purchase money, according to the circumstances of the affair. All this is settled by the chiefs assembled, if the parties cannot agree upon the terms amongst themselves.

In the ambel and marriage, when the father resolves to dismiss the husband of his daughter, and send him back to his doosoon, the sum for which

which he can redeem his wife and family, is an hundred dollars; and if he can raise that, and the woman is willing to go with him, the father cannot refuse them; and now the affair is changed into a koolo marriage; the man returns to his former toongooan (fettlement or family), and becomes of more consequence in society. These people are not strangers to that fentiment which we call a regard to family. There are some families among them more efteemed than others, though not graced with any title or employment in the state. The origin of this distinction, it is difficult to trace, but I am inclined to think that it arises from a succeffion of men of abilities. Every one has a regard to his race, and the probability of its being extinct, is esteemed a great unhappiness. This is what they call toongooan pootoofe, and the expression is used by the lowest member of the community. To have a wife, a family, collateral relations, and a fettled place of refidence, is to have a toongooan, and this they are anxious to support and perpetuate. It is with this view, that when a fingle female only remains of a family, they marry her by ambel ana; in which mode the husband's consequence is lost in the wife's, and in her children the toongooan of her father is continued. They find her a husband that will menegga toongooan, or as it is expressed amongst the Rejangs, menegga rooma, fet up the house again.

The femundo marriage is little known in Passummah. I recollect that a pangeran of Manna having a fon by a semundo marriage with a Malay woman, she refused, upon the father's death, to let the boy succeed to his dignities, and at the same time become answerable for his debts, and carried him with her from the country; which was productive of much confusion. Nor did it appear that the laws of the country could compel the child to be responsible for his father's engagements.

When a young woman is discovered to be with child before marriage, she, or more properly, her father, is fined forty dollars, or in failure of payment the girl becomes a flave. The man is fined thirty dollars. This is called gaway panjingan. The woman's fine goes to the calippah, and the man's to the inferior proatteens. The offending parties are likewise M m m obliged

obliged to give between them, a buffaloe and rice, to remove the stain, which ceremony is here called baffing loora. If the woman does not discover by whom she is become pregnant, she must pay the whole sine. This regulation has much severity, and falls particularly hard on the girl's father, who not only has his daughter spoiled, but must also pay largely for her frailty. To the northward, the offence is not punished with so much rigor, yet the instances are there said to be rarer, and marriage is more usually the consequence. In other respects the customs of Passummab and Rejang are the same, in these matters.

Rites of mar-

The rites of marriage, neeka, (from the Arabian word) confift simply in joining the hands of the parties, and pronouncing them man and wife, without much ceremony, excepting the entertainment which is given on the occasion. This is performed by one of the fathers, or the chief of the doofoon, according to the original customs of the country, but where Mahometanism has found its way, a padre or immum executes the business.

Courtship.

But little apparent courtship precedes their marriages. Their manners do not admit of it. The boojong and gaddees (youths of each fex) being carefully kept afunder, and the latter feldom trufted from under the wing of their mothers. Befides, courtship, with us, includes the idea of humble entreaty on the man's fide, and favor and condescention on the part of the woman, who bestows person and property, for love. The Sumatran, on the contrary, when he fixes his choice, and pays all that he is worth, for the object of it, may naturally confider the obligation on his fide. But still they are not without gallantry. They preserve a degree of delicacy and respect towards the sex, which might justify their retorting on many of the polished nations of antiquity, the ephithet of barbarians. The opportunities which the young people have, of feeing and converfing with each other, are at the bimbangs, or public festivals, held at the balli, or town hall of the doofoon. On these occasions the unmarried people meet together, and dance and fing in company. It may be supposed that the young ladies cannot be long without their particular

ticular admirers. The men, when determined in their regards, generally employ an old woman as their agent, by whom they make known their fentiments, and fend prefents to the female of their choice. The parents then interfere, and the preliminaries being fettled, a bimbang takes place. At these festivals, a goat, a buffaloe, or several, according to the Marriage festirank of the parties, are killed, for to entertain, not only the relations and invited guests, but all the inhabitants of the neighbouring country who chuse to repair to them. The greater the concourse, the more is the credit of the holt, who is generally, on these occasions, the father of the girl; but the different branches of the family, and frequently all the people of the doofoon, contribute a quota of rice.

The young women proceed in a body to the upper end of the balli. Order obserwhere there is a part divided off for them, by a curtain. The floor is fpread with their best mats, and the fides and ceiling of that extremity of the building, are hung with pieces of chintz, palampores, and the like. They do not always make their appearance before dinner; that time, with part of the afternoon, previous to a second or third meal. being appropriated to cock-fighting, and other diversions peculiar to the men. Whilft the young are thus employed, the old men confult together upon any affair that may be at the time in agitation; fuch as repairing a public building, or making reprifals upon the cattle of a neighbouring people. The bimbangs are often given on occasions of business only, and as they are apt to be productive of cabals, the Europeans require that they shall not be held without their knowledge and approbation. To give authority to their contracts and other deeds, whether of a public or private nature, they always make a bimbang. Writings, fay they, may be altered or counterfeited, but the memory of what is transacted and concluded in the presence of a thousand witnesses, must remain facred. Sometimes in token of the final determination of an affair, they cut a notch in a post, before the chiefs; which they call tacoo cayoo.

In the evening, their fofter amusements take place; of which the dances are the principal. These are performed either fingly, or by two of dancing.

women, two men, or with both mixed. Their motions and attitudes are usually flow, and too much forced to be graceful; approaching often to the lascivious, and not unfrequently the ludicrous. This is, I believe. the general opinion formed of them by Europeans, but it may be the effect of prejudice. Certain I am, that our usual dances are, in their judgment, to the full as ridiculous. The minuets they compare to the fighting of two gamecocks, alternately approaching and receding. Our country dances they efteem too violent and confused, without shewing grace or agility. The flage dances, I have not a doubt, would pleafe them. Part of the female dress, called the falendang, which is usually of filk, with a gold head, is tied round the waift, and the ends of this, they, at times, extend behind them with their hands. They bend forward as they dance, and usually carry a fan, which they close and strike fmartly against their elbows, at particular cadences. They keep time well, and the partners preserve a confistency with each other, though the figure and steps are ad libitum. A brisker movement is sometimes adopted, which proves more conformable to the tafte of the English spectators.

and finging.

Dancing is not the only amusement on these occasions. A gaddees fometimes rifes, and leaning her face on her arm, supporting herself against a pillar, or the shoulder of one of her companions, with her back to the audience, begins a tender fong. She is foon taken up, and answered, by one of the boojongs in company, whose greatest pretensions to gallantry and fashion, are founded on an adroitness at this polite accomplishment. The uniform subject, on such occasions, is love, and as the words are extempore, there are numberless degrees of merit in the composition, which is fometimes furprizingly well turned, quaint, and even witty. There are also characters of humor amongst the men, who, by buffoonery, mimickry, punning, repartee, and fatire, (rather of the Sardonic kind) are able to keep the company in laughter, at intervals, during the course of a night's entertainment. The affembly seldom breaks up before day light, and these bimbangs are often continued for several days together, till their stock of provisions is exhausted. The young men frequent

frequent them in order to look out for wives, and the lasses of course fet themselves off to the best advantage. They wear their best silken Dresses. dreffes, of their own weaving; as many ornaments of fillagree as they poffess; filver rings upon their arms and legs, and earings of a particular construction. Their hair is variously adorned with flowers, and perfumed with oil of benjamin. Civet is also in repute, but more used by the men. To render their skin fine, smooth, and soft, they make use cometic used, of a white cosmetic called poopoor. The mode of preparing it is as fol-preparing it. lows. The basis is fine rice, which is a long time steeped in water. then dried, reduced to a powder, and by wetting made into a paste. They mix with this, ginger; and the leaf of a plant called deelum (patch leaf), which gives it it's peculiar fmell, and also, as is supposed, a cooling quality. They add likewise the flowers of the jagong (maize); cayoo bendano (fandal wood); and the feeds of a plant called there capar antoo, (fairy cotton) which is the abel mose, or musk feed. All these ingredients, after being well mixed together, are made up into little balls. and when they would apply the cosmetic, these are diluted with a drop of water, rubbed between the hands, and then on the face, neck, and shoulders. They have an apprehension, probably well founded, that a too abundant or frequent application, will, by stopping the pores of the skin, bring on a fever. It is used, with good effect, to remove that troublesome complaint, so well known to Europeans in India, by the name of the prickly heat; but it is not always fafe for strangers thus to check the operations of nature, in a warm climate. The Sumatran girls, as well as our English maidens, entertain a favorable opinion of the virtues of morning dew, as a beautifier, and believe that by rubbing it to the roots of the hair, it will strengthen and thicken it. With this view they take pains to catch it before fun-rife, in veffels, as it falls.

If a wedding is the occasion of the bimbang, the couple are married, co summation perhaps the fecond or third day; but it may be two or three more, ere the husband can get possession of his bride; the old matrons making it a rule to prevent him, as long as possible, and the bride herself holding

Nnn

it as a point of honor, to defend to extremity that jewel, which she would yet be disappointed in preserving.* They fit up in state, at night, on raifed cushions, in their best cloaths and trinkets. They are sometimes loaded on the occasion, with all the finery of their relations, or even the whole doofoon; and carefully eafed of it when the ceremony is over. But this is not the case with the children of persons of rank. I remember being present at the marriage of a young woman, whose beauty would not have difgraced any country, with a fon of Raddeen, prince of Madura, to whom the English gave protection from the power of the Dutch, after his father had fallen a facrifice. She was decked in unborrowed plumes. Her drefs was eminently calculated to do justice to a fine person; her hair, in which confists their chief pride; was disposed with extreme grace; and an uncommon elegance and taste were displayed, in the workmanship and adjustment of her ornaments. It must be confessed, however, that this taste is by no means general, especially amongst the country people. Simplicity, so effential to the idea, is the characteristic of a rude and quite uncivilized people; and is again adopted by men in their highest state of refinement. The Sumatrans stand removed from both these extremes. Rich and splendid articles of drefs and furniture (though not often procured) are the objects of their vanity and ambition.

The bimbangs are conducted with great decorum and regularity. The old women are very attentive to the conduct of the girls, and the male relations are highly jealous of any infults that may be shewn them. A lad, at one of these entertainments, asked another his opinion of a gaddees who was then dancing. "If she was plated with gold, replied he, I would not take her for my concubine, much less for my wife." A brother of the girl happened to be within hearing, and called him to

It is recorded, that the jealoufy between the English and Dutch at Bantam, arose from a preference shewn to the former by the King, at a festival which he gave upon obtaining a victory of this nature, which his bride had long disputed with him.

[†] The circumstances of this disgraceful affair, are preserved in a book entitled "A Voyage to the East Indies in 1747 and 1748."

account for the reflection thrown on his fifter. Creefes were drawn, but the bystanders prevented mischief. The brother appeared the next day, to take the law of the defamer, but the gentleman, being of the reefow cast, had absconded, and was not to be found.

The customs of the Sumatrans permit their having as many wives by Number of joojcor, as they can compass the purchase of, or afford to maintain; but it is extremely rare that an inflance occurs of their having more than one, and that only among a few of the chiefs. This continence they in fome measure owe to their poverty. The dictates of frugality are more powerful with them, than the irregular calls of appetite, and make them decline an indulgence, that their law does not restrain them from. In talking of polygamy, they allow it to be the priviledge of the rich, but regard it as a refinement which the poor Rejangs cannot pretend to. Some young reefows have been known to take wives in different places. but the father of the first, as soon as he hears of the second marriage, procures a divorce. A man married by semundo cannot take a second wife, without repudiating the first, for this obvious reason, that two or

more persons could not be equally entitled to the half of his effects.

Montesquieu infers, that the law which permits polygamy, is physically conformable to the climate of Afia. The feafon of female beauty, Polygamy precedes that of their reason, and from its prematurity soon decays. The empire of their charms is short. It is therefore natural, the prefident observes, that a man should leave one wife to take another: that he should seek a renovation of those charms which had withered in his possession. But are these the real circumstances of polygamy? furely not. It implies the cotemporary enjoyment of women in the fame predicament; and I should consider it as a vice, that has its source in the influence of a warm atmosphere, upon the passions of men, which, like the cravings of other difordered appetites, make them miscalculate their wants. It is probably the fame influence, on lefs rigid nerves, that renders their thirst of revenge so much more violent, than among northern nations; but we are not therefore to pronounce murder to be physically conform-

conformable to a fouthern climate. Far be it from my intention however, to put these passions on a level; I only mean to shew that the
president's reasoning proves too much. It must further be considered,
that the genial warmth which expands the desires of the men, and
prompts a more unlimited exertion of their faculties, does not inspire
their constitutions with proportionate vigor, that on the contrary, renders
them, in this respect, inserior to the inhabitants of the temperate zone;
whilst it equally influences the desires of the opposite sex, without being
found to diminish from their capacity of enjoyment. From which I
would draw this conclusion, that if nature intended that one woman only
should be the companion of one man, in the colder regions of the earth,
it appears also intended, à fortiori, that the same law should be observed
in the hotter; inferring nature's design, not from the desires, but from
the abilities with which she has endowed mankind.

Montesquieu has further suggested, that the inequality in the comparative numbers of each sex, born in Asia; which is represented to be greatly superior on the semale side; may have a relation to the law that allows polygamy. But there is strong reason to deny the reality of this supposed excess. The Japan account, taken from Kæmser, which makes them to be in the proportion of twenty two to eighteen, is very inconclusive, as the numbering of the inhabitants of a great city, can surnish no proper test; and the account of births at Bantam, which states the number of girls to be ten, to one boy, is not only manifestly absurd, but positively salse. I can take upon me to affert, that the proportion of the sexes, throughout Sumatra, does not sensibly differ from that ascertained in Europe; nor could I ever learn from the inhabitants of the many eastern islands whom I have conversed with, that they were conscious of any disproportion in this respect.

Connexion between polygamy and purchase of wives. But from whatever source we derive polygamy, its prevalence seems to be universally attended with the practice of giving a valuable confideration for the woman, instead of receiving a dowry with her. This is a natural consequence. Where each man endeavors to engross several,

the demand for the commodity, as a merchant would express it, is encreased, and the price of course enhanced. In Europe on the contrary, where the demand is small; whether owing to the paucity of males from continual diminution; their coldness of constitution, which suffers them to play rather with the fentimental, than act from the animal paffion; their corruption of manners, leading them to promiseuous concubinage; or in fine, the extravagant luxury of the times, which renders a family an infupportable burthen; -whatever may be the cause, it becomes neceffary, in order to counteract it, and produce an additional incitement to the marriage state, that a premium be given with the females. We find in the history of the earliest ages of the world, that where a plurality of women was allowed of, by law or custom, they were obtained by money or fervice. The form of marriage by Semundo, among the Malays, which admits but of one partner, requires no fum to be paid by the husband to the relations of the wife, except a trifle, by way of token, or to defray the expences of the wedding feast. The circumstance of the Rejangs confining themselves to one, and at the same time giving a price for their wives, would feem an exception to the general rule laid down; but this is an accidental, and perhaps temporary restraint, arising, it may be, from the European influence, which tends to make them regular and industrious, but keeps them poor: affords the means of subfishence to all, but the opportunity of acquiring riches to few or none. In their genuine state, war and plunder caused a rapid fluctation of property; the little wealth now among them, derived mostly from the India Company's expenditure, circulates through the country in an equal stream, returning chiefly, like the water exhaled in vapors from the fea, to its original fource. The custom of giving joojoors, had most probably, its foundation in polygamy; and the superstructure subsists, though its basis has partly mouldered away: but being fearcely tenantable, the inhabitants are inclined to quit, and fuffer it to fall to the ground. Moderation in point of women destroying their principle, the joojoors appear to be devoid of policy. Open a new fpring of luxury, and polygamy now confined to a few individuals among ft the chiefs, will spread throughout the people. Beauty will be in high request; each fair one will be fought 000 for

for by many competitors; and the payment of the joojoor be again efteemed a reasonable equivalent for possession. Their acknowledging the custom, under the present circumstances, to be a prejudicial one; so contrary to the spirit of eastern manners, which is ever marked with a blind veneration for the establishments of antiquity; contributes to strengthen considerably the opinion I have advanced.

or in fine, the extravagant lexury of the times, which renders a family

Gaming.

Throughout every rank of the people there prevails a strong spirit of gaming, which is a vice that readily infinuates itself into minds naturally averse from the avocations of industry. The thoughts of man are active, and where the sphere is circumscribed, they rush into those channels which convey them with the most rapidity. Gaming being in general a fedentary occupation, is more adapted to a warm climate, where bodily exertion is, in very few inftances, confidered as an amusement. A common species of gambling is with dice, (dadoo*) but these, throughout the pepper diffricts, are rigorously forbid; because it is not only the child, but the parent of idleness, and by the event of play, often throws whole villages into confusion. Cock fighting they are still more pasfionately addicted to, and it is indulged to them under certain regulations. Where they are perfectly independent, their propenlity to it is fo great, that it refembles rather a ferious occupation, than a fport. You feldom meet a man travelling in the country, without a cock under his arm, and fometimes fifty in a company, when there is a bimbang in one of the neighbouring villages. A country man coming down, on any occasion, to the qualloe, or mouth of the river, if he boasts the least degree of spirit, must not be unprovided with this token of it. They often game high at their meetings; particularly when a fuperstitious faith in the invincibility of their bird, has been strengthened by past success. An hundred Spanish dollars is no very uncommon rifk, and instances have occurred of a father's staking his children or wife, and a fon, his mother or fifters, on the iffue of a battle; when a

Dice.

Cock highting

^{*} There is reason to conclude, from the name, that Dice were introduced in this part of the world by the Portuguese, and done the part of the world by the Portuguese, and done the part of the world by the Portuguese.

run of ill luck has stripped them of property, and rendered them defperate. Quarrels, attended with dreadful consequences, have often arisen on these occasions. The same and the same and sold adapted in and

By their customs, there are four umpires appointed to determine on all Rules of cockdisputed points in the course of the battles; and from their decision there lies no appeal; except the Gothic appeal to the fword. A perfon lofing, and who has not the ability to pay, is immediately profcribed; departs with difgrace, and is never again suffered to appear at the galangang. This cannot with propriety be translated, a cock-pit, as it is generally a fpot on the level ground, or a stage erected, and covered in. It is enclosed with a railing which keeps off the spectators; none but the handlers and heelers being admitted within fide. A man who has an high opinion of, and regard for his cock, will not fight him under a certain number of dollars, which he places in order on the floor: his poorer adverfary is perhaps unable to deposit above one half: the standers by make up the fum, and receive their dividends in proportion, if fuccessful. A father, at his death-bed, has been known to defire his fon, to take the first opportunity of matching a certain cock, for a sum equal to his whole property, under a blind conviction of it's being between, or invulnerable.

Cocks of the same color are never matched, but a grey against a pile, Matches. a yellow against a red, or the like. This might have been originally defigned to prevent disputes, or knavish impositions. The Malay breed of cocks is much efteemed by connoiffeurs who have had an opportunity of trying them. Great pains is taken in the rearing and feeding; they are frequently handled, and accustomed to spar in public, in order to prevent any flyness. Contrary to our laws, the owner is allowed to take up. and handle his cock, during the battle; to clear his eye of a feather, or his mouth of blood. When a cock is killed, or runs, the other must have fufficient spirit and vigor left, to peck at him three times, on his being held to him for that purpose, or it becomes a drawn battle; and fometimes an experienced cocker will place the head of his vanquished bird, in such an uncouth posture, as to terrify the other, and render him unable

unable to give this proof of victory. The cocks are never trimmed, but matched in full feather. The artificial spur used in Sumatra, resembles in shape the blade of a scimitar, and proves a more destructive weapon than the European spur. It has no socket, but is tied to the leg, and in the position of it, the nicety of the match is regulated. As in horse racing, weight is proportioned to inches, so in cocking, a bird of fuperior weight and fize, is brought to an equality with his adverfary, by fixing the fteel four fo many scales of the leg above the natural spur, and thus obliging him to fight with a degree of difadvantage. It rarely happens that both cocks furvive the combat.

In the northern parts of the island, where gold dust is the common medium of gambling, as well as of trade, fo much is accidentally dropt in weighing and delivering, that at some cockpits, where the resort of people is great, the fweepings are faid; probably with exaggaration: to be worth upwards of a thousand dollars per annum to the owner of the ground; befide his profit of two fanams (five pence) for each battle.

Quail fighting. In fome places they match quails, in the manner of cocks. These fight with great inveteracy, and endeavour to feize each other by the tongue. The Achenese bring also into combat the dial bird, (moori) which refembles a small magpye, but has an agreeable, though imperfect note. They fometimes engage one another on the wing, and drop to the ground in the struggle.

Fencing.

They have other diversions of a more innocent nature. Matches of fencing, or a species of tournament, are exhibited on particular days; as at the breaking up of their annual fast, or month of ramadan, called there the pocasso. On these occasions they practice strange attitudes, with violent contorfions of the body, and often work themselves up to a degree of frenzy; when the old men step in, and carry them off. These exercifes, in some circumstances resemble the idea which the ancients have given us of the pyrric or war dance; the combatants moving at a distance from each other, in cadence, and making many turns and springs, unnecessary in the representation of a real combat. This entertainment

is more common among the Malays, than in the country. The chief weapons of offence used by these people, are the coojoor or lance, and the creese. This last is properly Malay, but in all parts of the island, they have a weapon equivalent: though in general less curious in their structure, wanting that waving in the blade, for which the creese is remarkable, and approaching nearer to daggers or knives.

Among their exercises we never observe jumping or running. They finile at the Europeans, who, in their excursions, take so many unnecesfary leaps. The custom of going barefoot, may be a principal impediment to this practice, in a country overrun with thorny shrubs; and where no fences render it a matter of expediency.

They have a diversion similar to that described by Homer, as practifed tossing a ball. amongst the Phœecians, which confists in tossing an elastic, wicker ball, from one to the other, in a large party. They arrive to a great degree of dexterity in the sport, receiving it, with equal facility, on the foot or hand, the heel or the toe; from whence it is thrown either perpendicularly into the air, and caught again, or obliquely to some other person of the company, who stand in an extended circle. It is to be remarked that the Sumatrans are, in general, very expert in the use of their feet, employing them, as their hands, to lift any thing, not heavy, from the ground, between the great and fecond toe, or by a contraction of the whole foot.

The Sumatrans, and more particularly the Malays, are much at- Smoking of tached, in common with many other eastern people, to the custom of smoking opium. The poppy which produces it, not growing on the island, it is annually imported from Bengal in considerable quantities, in chefts containing an hundred and forty pounds each. It is made up in cakes of five or fix pound weight, and packed with dried leaves; in which fitustion it will continue good and valuable for two years, but after that period grows hard, and diminishes considerably in value. It is of a darker Ppp color,

color, and has less strength than the Turkey opium. About an hundred and sifty chests are consumed annually on the West coast, where it is purchased, on an average, at three hundred dollars the chest, and sold again at five or fix. But on occasion of extraordinary scarcity I have known it to sell for it's weight in silver, and a single chest to fetch upwards of three thousand dollars.

The method of preparing it for use is as follows. The raw opium is first boiled or seethed in a copper vessel; then strained through a cloth, to free it from impurities; and then a second time boiled. The leaf of the bacco, shred sine, is mixed with it, in a quantity sufficient to absorb the whole; and it is afterwards made up into small pills, about the size of a pea, for smoking. One of these being put into the small tube that projects from the side of the opium pipe, that tube is applied to a lamp, and the pill being lighted, is consumed at one whist, or instation of the lungs. The smoke is never emited by the mouth; it usually receives vent through the nostrils, and sometimes, by adepts, through the passage of the ears and eyes. This preparation of the opium is called muddat, and is often adulterated in the process, by mixing jaggree, or pine sugar, with it; as is the raw opium, by incorporating with it, the fruit of the pesang or plantain.

Effects of Opium.

The use of opium among these people, as that of intoxicating liquors among other nations, is a species of luxury, which all ranks adopt according to their ability, and which, when once become habitual, it is almost impossible to shake off. Being however, like other luxuries, expensive, sew only, among the lower class of people, can compass the regular enjoyment of it; even where it's use is not restrained, as it is among the pepper planters, to the times of their festivals. That the practice of opium smoking must be in some degree prejudicial to the health, is highly probable; yet I am inclined to think that effects have been attributed to it, much more pernicious to the constitution, than it is in reality the cause of. The Bugguess soldiers, and others in the Malay bazars, whom we see most attached to it, and who use it to excess, commonly appear emaciated;

emaciated; but they are in other respects abandoned and debauched. The Leemson and Batang Affy gold traders, on the contrary, who are an active, laborious, people, but yet indulge as freely in opium as any others whatever, are, notwithstanding, the most healthy and vigorous people to be met with on the island. It has been usual also to attribute to the practice; destructive consequences of another nature; from the frenzy it has been supposed to excite in those who take it in quantities. But this should probably rank with the many errors that mankind have been led into, by travellers addicted to the marvellous; and there is every reason to believe, that the furious quarrels, desperate affaffinations, and fanguinary attacks, which the use of opium is said to give birth to, are idle notions, originally adopted through ignorance, and fince maintained, from the mere want of investigation, without having any solid foundation. That those desperate acts of indiscriminate murder, called by us, mucks, and by the natives, mongamo, do actually take place, and in some parts of the east, frequently, (on Java in particular) is not to be controverted; but it is not equally evident that they proceed from any intoxication, except that of their unruly passions. Too often they are occasioned by excess of cruelty and injustice in their oppressors. On the West coast of Sumatra about twenty thousand pounds weight of this drug, are confumed annually, yet instances of this crime do not happen. (at least within the scope of our knowledge) above once in two or three years. During my refidence there I had an opportunity of being an eye witness but to one muck. The flave of a Portugueze woman, a man of the island of Neas, who in all probability had never handled an opium pipe in his life, being treated by his mistress with extreme severity, for a trifling offence, vowed he would have revenge, if the attempted to frike him again; and ran down the steps of the house, with a knife in each hand, as it was faid. She cried out, mongamo! The civil guard was called, who having the power, in these cases, of exercising summary justice, fired half a dozen rounds, into an outhouse, where the unfortunate wretch had sheltered himself, on their approach; and from whence he was at length dragged, covered with wounds. Many other mucks

mucks might perhaps be found, upon ferutiny, of the nature of the foregoing, where a man of strong feelings was driven, by excess of injury, to domestic rebellion.

It is true that the Malays, when, in a state of war, they are bent on any daring enterprize, fortify themselves with a few whists of opium, to render them infenfible to danger; as the people of another nation are faid to take a dram; but it must be observed that, the resolution for the act, precedes, and is not the effect of the intoxication. They take the fame precaution, previous to being led to public execution, but on these occasions shew greater figns of stupidity, than frenzy. Upon the whole, it may be reasonably concluded, that the sanguinary atchievements, for which the Malays have been famous, or infamous rather, in history, are more justly derived from the natural ferocity of their disposition, than from the qualities of any drug whatever. The pretext of the foldiers of the country guard, for using opium, is, that it may render them watchful on their nightly posts: we, on the contrary, administer it to procure fleep; and according to the quantity it has either effect. The delirium it produces is known to be so very pleasing, that Pope has supposed this to have been defigned by Homer, when he describes the delicious draught prepared by Helen, called Nepenthe, which exhilerated the spirits, and banished from the mind the recollection of woe.

It is remarkable that at *Batavia*; where the affaffins just now described, when taken alive, are broken on the wheel, with every aggravation of punishment that the most rigorous justice can instict; the mucks yet happen in great frequency; whilst at *Bencoolen*, where they are executed in the most simple and expeditious manner, the offence is extremely rare. Excesses of severity in punishment may deter men from deliberate, and interested acts of villany, but they add fuel to the atrocious enthusiasm of desperadoes. A further proof of the influence that mild government has upon the manners of people, is, that the piratical adventures, so common on the eastern coast of the island, are unknown on the western. Far from our having apprehensions of the *Malays*, the guards at the smaller

Piractical ad-

English settlements, are almost entirely composed of them, with a mixture of Bugguess or Macassar people. Europeans, attended by Malays only, are continually travelling through the country. They are the only persons employed in carrying treasure to distant places; in the capacity of secretaries for the country correspondence; as civil officers, in seizing delinquents, among the planters, and elsewhere; and as masters and fupercargoes of the tombongons, praws, and other small coasting vessels: So great is the effect which habit has upon a national character effeemed the most treacherous and fanguinary. a mill May sooms don't lo novel ont

Custom of chewing Betel—Emblematic presents—Oratory—Children—Names—Circumcision—Funerals.

Custom of chewing betel.

WHETHER to blunt the edge of painful reflection, or owing to an aversion our natures have from total inaction, most nations have been addicted to the practice of enjoying by mastication, or otherwise, the flavor of fubstances possessing an inebriating quality. The South Americans chew the cocoa and mambee, and the eastern people, the betel and areca, or, as they are called in the Malay language, seeree and penang. This cuftom has been accurately described by various writers, and therefore it is almost superfluous to say more on the subject, than that the Sumatrans univerfally use it; carry the ingredients constantly about them; and serve it to their guests on all occasions; the prince in a gold stand, and the poor man in a brass box, or mat bag. The betel stands of the better rank of people, are usually of filver, embossed with rude figures. The Sultan of Moco Moco was prefented with one by the India Company, with their arms on it; and he possesses beside, another of gold fillagree. The form of the stand is the frustrum of an hexagonal pyramid, reverfed; about fix or eight inches in diameter. It contains many fmaller veffels, fitted to the angles, for holding the nut, leaf and chunam, which is quick lime made from calcined shells; with places for the instruments employed in cutting the first, (cacheep), and spatulas for fpreading the last.

When the first salutation is over; which consists in bending the body, and the inferior's putting his joined hands between those of the superior, and then lifting them to his forehead; the betel is presented as a token of hospitality, and an act of politeness. To omit it on the one hand, or to reject it on the other, were an affront; as it would be likewise, in a person of subordinate rank, to address a great man, without the precaution of chewing it before he spoke. All the preparation consists in spreading on the seeree leaf, a small quantity of the chunam, and folding

it up with a flice of the penang nut. Some add to these, gambeer, which is the leaf of a particular tree, chopped, boiled, and made up into little; balls; and tobacco, which is fhred fine for the purpose, and carried between the lip, and upper row of teeth. From the mastication of the first three, proceeds a juice which tinges the faliva of a bright red, and which the leaf and nut, without the chunam, will not yield. This hue being communicated to the mouth and lips, is esteemed ornamental; and an agreeable flavor is imparted to the breath. The juice is usually, though not always, fwallowed by the chewers of betel. We might reasonably fuppose that its active qualities would injure the coats of the stomach, but experience feems to difprove fuch a consequence. It is common to fee the teeth of elderly persons stand loose in the gums, which is probably the effect of this custom, but I do not think that it affects the foundness of the teeth themselves. Children begin to chew betel very young, and yet their teeth are always beautifully white, till pains are taken to disfigure them, by filing, and flaining them black. To perfons unhabituated to the composition, it causes a strong giddiness, astringes and excoriates the tongue and fauces, and destroys for a time the faculty of taste. During the pocasso, or fast of Ramadan, the Mahometans among them, abstain from the use of betel, whilst the sun continues above the horizon; but excepting at this feafon, it is the constant luxury of both fexes, from an early period of childhood, till, becoming toothlefs. they are reduced to the necessity of having the ingredients previously reduced to a paste for them, that without further effort the betel may diffolve in the mouth. Along with the betel, and generally in the chunam, is the mode of conveying philtres, or love charms. How far they prove effectual I cannot take upon me to fay, but suppose that they are of the nature of our stimulant medicines, and that the direction of the passion is of course indiscriminate. The practice of administering poifon in this manner, is not followed in latter times; but that the idea is not fo far eradicated, as entirely to prevent fuspicion, appears from this circumstance; that the guest, though taking a leaf from the betel service of his entertainer, not unfrequently applies to it his own chunam, and never omits to pass the former between his thumb and fore finger, in order

doubtlefa

order to wipe off any extraneous matter. This miftrufful procedure is so common as not to give offence. I quide some reliable and a land and balance a

Tobacco.

Beside the mode beforementioned of enjoying the slavor of tobacco, it is also smoked by the natives, and for this use, after shredding it sine, whilst green, and drying it well, it is rolled up in leaves of the neepa tree (a species of palm), and it is in that form called roko. The rokos are carried in the betel-box, or more commonly under the daytar or handerchief which, in imitation of a turban, surrounds the head. Much tobacco is likewise imported from China, and sells at a high price. It seems to possess a greater pungency than the Sumatran plant.

Emblematic presents. The custom of sending emblematical presents, in order to make known, in a covert manner, the birth, progress, or change of certain affections of the mind, prevails here, as in some other parts of the east; but the sentiments of the correspondents are not conveyed in the elegant manner, which some writers have described, as prevailing in Turkey and elsewhere, by means of slowers, of different hues, variously combined in nosegays. Small parcels of salt, cayenne pepper, betel, and the like, are here employed, which, among adepts, are known to denote love, jealously, resentment, hatred, and other strong feelings.

Oratory.

The Sumatrans in general are good speakers. The gift of oratory seems natural to them. I knew many among them, whose harangues I have listened to with pleasure and admiration. This may be accounted for, perhaps, from the constitution of their government, which being far removed from despotism, seems to admit, in some degree, every member of the society, to a share in the public deliberations. Where personal endowments, as has been observed, will often raise a private man to a share of importance in the community, superior to that of a nominal chief, there is abundant inducement for the acquisition of these valuable talents. The forms of their judicial proceedings, likewise, where there are no established advocates, and each man depends upon his own, or his friend's abilities, for the management of his cause, must doubtless

doubtless contribute to this habitual eloquence. We may add to these conjectures, the nature of their domestic manners, which introduce the fons, at an early period of life, into the bufiness of the family, and the counsels of their elders. There is little to be perceived among them, of that paffion for childish sports which marks the character of our boys, from the feventh to the fourteenth year. On Sumatra you will observe infants, not exceeding the former age, full dreffed, and armed with a creefe, feated in the circle of the old men of the doofoon, and attending to their debates with a gravity of countenance not surpassed by their grandfathers. Thus initiated, they are qualified to deliver an opinion in public, at a time of life, when an English schoolboy could scarce return an answer to a question, beyond the limits of his grammar or fyntax, which he has learned by rote. It is not a little unaccountable, that this people, who hold the art of speaking in such high esteem, and evidently pique themfelves on the attainment of it, should yet take so much pains to destroy the organs of speech, in filing down, and otherwise disfiguring their teeth; and likewise adopt the uncouth practice of filling their mouths with betel, whenever they prepare to hold forth. We must conclude, that it is not upon the graces of elocution they value an orator, but his artful and judicious management of the fubject matter; together with a copioulnels of phrase, a perspicuity of thought, an advantageous arrangement, and a readiness, especially, at unravelling the difficulties and intricacies of their fuits.

The curse entailed on women in the article of child-bearing, does Child-bearing. not fall so heavy in this, as in the northern countries. Their pregnancy, fearcely at any period prevents their attendance on the ordinary domestic duties; and usually within a few hours after their delivery, they walk to the bathing place, at a small distance from the house. The presence of a femme fage is often esteemed superfluous. This facility of parturition may probably be owing to the relaxation of the frame, from the warmth of the climate; to which cause also, may be attributed the paucity of children borne by the Sumatran women, and the early decay of their beauty and strength. They have the tokens of old age, at a feafon of

life when European women have not passed their prime. The early communication between the sexes, may possibly contribute to shortent both their lives and stature. They are like the fruits of the country, soon ripe, and soon decayed. They bear children before sisteen, are generally passed it at thirty, and grey-headed and shrivelled at forty. I do not recollect hearing of any woman who had six children, except the wife of Raddeen of Madura, who had more, and she, contrary to the universal custom, did not give suck to hers.

Treatment of children.

Mothers carry the children, not on the arm, as our nurses do, but straddling on the hip, and usually supported by a cloth, which ties in a knot on the opposite shoulder. This practice, I have been told, is common in some parts of Wales. It is much safer than the other method, less tiresome to the nurse, and the child has the advantage of sitting in a less constrained posture: but the defensive armour of stays, and offensive weapons called pins, might be some objection to the general introduction of the sashion in England. The children are nursed but little; not confined by any swathing or bandages; and being suffered to roll about the sloor, soon learn to walk and shift for themselves. When cradeless are used, they swing suspended from the ceiling of the rooms.

Age of the people.

The country people can very seldom give an account of their age, being entirely without any species of chronology. Among those who profess themselves Mahometans, to very sew is the number of the Hegira known; and even of those who in their writings make use of it, not one in ten can pronounce in what year of it they were born. After a few taoun paddre (harvests) are elapsed, they are bewildered in regard to the date of an event, and only guess at it from some cotemporary circumstances of notoriety; as the appointment of a particular dupatty; the incursion of a certain enemy, or the like. As far as can be judged from observation, it would seem, that sew attain to the age of sifty, and sixty years is extreme long life.

Names.

The children, among the Rejangs, have generally a name given them by their parents, foon after their birth, which is called "name dagging."

The

The galar (cognomen), another species of name; or title, as we improperly translate it; is bestowed at a subsequent, but not at any determinate period: fometimes, as the lads rife to manhood, at an entertainment given by the parent, on some particular occasion; and often at their marriage. It is generally conferred by the old men of the neighbouring villages. when affembled; but instances occur of its being, irregularly, affumed by the persons themselves; and some never obtain any galar. It is also not unufual, at a convention held on bufiness of importance, to change the galar of one or two of the principal personages, to others of superior estimation; though it is not easy to discover in what this preeminence confifts; the appellations being entirely arbitrary, at the fancy of the conferers: perhaps in the loftier found, or more pompous allution in the fense, which latter is sometimes carried to an extraordinary pitch of bombast, as in the instances of " Poongoonchongboomee," or " Shaker of the world;" the title of a pangeran of Manna. But a climax is not al. ways perceptible in the change.

The father, in many parts of the country, and particularly in Passum- Father named mah, is distinguished by the name of his first child; as " Pa-Laddeen," from his child, or " Pa-Rindoo;" (" Pa" for " bapa," fignifying " the father of") and loses in this acquired, his own proper name. This is a fingular custom, and furely less conformable to the order of nature, than that which names the fon from the father. There, it is not usual to give them a galar, on their marriage, as with the Rejangs, among whom the filionomic is not fo common, though fometimes adopted, and perhaps joined with the galar; as Raddeen-pa-Chirano. The women never change the name given them at the time of their birth; yet frequently they are called. through courtefy, from their eldest child, "Ma fe anno," the mother of fuch an one;" but rather as a polite description, than a name. The word or particle "Se," is always prefixed to proper names of persons, where the name confifts of but a fingle word; as Se Bintang; but not Se Mallim Malleeo.

A Sumatran ever scrupulously abstains from pronouncing his own name; Hestate to pronot, as I understand, from any motive of superstition, but merely as a nounce their punctilio

third perion.

punctilio in manners. It occasions him infinite embarraffment, when a stranger, unacquainted with their customs, requires it of him. As soon as he recovers from his confusion, he solicits the interposition of his neighbour. He is never addressed; except in the case of a superior dic-Address in the tating to his dependant; in the second person, but always in the third; using his name, or title, instead of the pronoun; and when these are unknown, a general title of respect is substituted, and they say, for instance, " apo orang cayo poonia sooco?" " what is his honor's pleasure" for " what is your, or your honor's pleasure." When criminals, or other ignominious persons, are spoken to, they make use of pronouns personal, both masculine and feminine (" ong" " caow") particularly expressive of contempt. The idea of difrespect annexed to the use of the second person, in discourse, though difficult to be accounted for, seems pretty general in the world. The Europeans, to avoid the supposed indecorum, exchange the fingular number for the plural; but I think, with lefs propriety of effect than the Afiatic mode; if to take off from the bluntness of address, be the object aimed at.

Circumcifion.

The boys are circumcifed, where Mahometanism prevails, between the fixth and tenth year. The ceremony is called booang maloo (casting away their shame), and a bimbang is usually given on the occasion; as well as at the ceremony of boring their daughters ears, and filing their teeth, (before described), which takes place at about the same age; and before which is performed, they cannot, with propriety, be married.

Funerals.

At their funerals, the corpfe is carried to the place of interment, on a broad plank, which is kept for the public fervice of the doofoon, and lasts for many generations. It is constantly rubbed with lime, either to preserve it from decay, or to keep it pure. No coffin is made use of; the body being fimply wrapped in white cloth, particularly of the fort called bummums. In forming the grave, after digging to a convenient depth, they make a cavity in the fide, at bottom, of fufficient dimenfions to contain the body; by which means the earth literally lies light upon it; and this cavity, after strewing flowers in it, they stop up by two boards,

boards, fastened angularly to each other, so that the one is on the top of the corpfe, whilst the other defends it on the open fide; the edge resting on the bottom of the grave. The outer hole is then filled up with earth; and little white flags, or streamers, are stuck in order around. They likewise plant a shrub, bearing a white flower, called coombanganocjoor, and in some places, wild marjoram. The women who attend the funeral make a hideous noise, not much unlike the Irish howl. On the third and feventh day, the relations perform a ceremony at the grave, called condonee; and at the end of twelve months, the ceremony of tegga battoo, or fetting up a few long, eliptical stones, at the head and foot; which being fcarce in fome parts of the country, bear a confiderable price. On this occasion, they kill and feast on a buffaloe, and leave the head to decay on the spot, as a token of the honor they have done the deceased, in eating to his memory. The burying places are called crammat. They are held in extraordinary reverence, and the least diffurbance or violation of the ground, though all traces of the graves be obliterated, is regarded as an unpardonable facrilege.

In works descriptive of the manners of people little known to the Religional world, the account of their religion, usually constitutes an article of the first importance. Mine will labor under the contrary disadvantage. The ancient and genuine religion of the Rejangs; if in fact they ever had any; is fcarcely now to be traced; and what principally adds to its obscurity, and the difficulty of getting information on the subject, is, that even those among them who have not been initiated in the principles of Mahometanism, yet regard those who have, as persons advanced a step in knowledge beyond them, and therefore hefitate to own circumstantially, that they remain still unenlightened. Ceremonies are fascinating to mankind, and without comprehending with what views they were inflituted, the profanum vulgus naturally give them credit for fomething mysterious and above their capacities; and accordingly pay them a tribute of respect. With Mahometanism, a more extensive field of literature (I speak in comparison) is opened to it's converts, and some additional notions of science are conveyed. These help to give it importance; though it must be confessed they are not the most pure tenets

of that religion, which have found their way to Sumatra; nor are even the ceremonial parts very scrupulously adhered to. Many who profess to follow it, give themselves not the least concern about it's injunctions, or even know what they require. A Malay at Manna, upbraided a countryman, with the total ignorance of religion, his nation labored under. "You pay a veneration to the tombs of your ancestors: what foundation have you for supposing that your dead ancestors can lend you affistance?" "It may be true; answered the other; but what soundation have you, for expecting affistance from Allah and Mahomet?" Are you not aware; replied the Malay; that it is written in a Book: have you not heard of the Koraan?" The native of Passummah, with conscious inferiority, submitted to the force of this argument.

If by religion is meant a public or private form of worship, of any kind; and if prayers, proceffions, meetings, offerings, images, or priefts, are any of them necessary to constitute it, I can pronounce that the Rejangs are totally without religion, and cannot, with propriety, be even termed Pagans, if that, as I apprehend, conveys the idea of mistaken worship. They neither worship God, devil, nor idol. They are not, however, without superstitious beliefs of many kinds, and have certainly a confused notion; though perhaps derived from their intercourse with other people; of some species of superior beings, who have the power of rendering themselves visible or invisible, at pleasure. These they call "orang aloos" "fine, or impalpable men," and regard them as possessing the faculty of doing them good or evil; deprecating their wrath, as the fense of present misfortunes, or apprehension of future, prevails in their minds. But when they speak particularly of them, they call them by the appellations of "malaykat", and "jinn," which are the angels, and evil spirits of the Arabians, and the idea may probably have been borrowed, at the same time with the names. These are the powers they also refer to, in an oath. I have heard a dupatty say, "my grandfather took an oath that he would not demand the joojoor of that woman, and imprecated a curse on any of his descendants that should do it : I never have, nor could I without fala kapada malaykat an offence

ands; or perhaps its proprefs was in a convery direction.

fence against the angels." Thus they say also, " de tolong nebbee, malaykat" the prophet and angels affifting." This is pure Mahometanifm.

The clearest proof that they never entertained an idea of Theisin, or No name for the belief of one fupreme power, is, that they have no word in their language to express the person of God, except the " Allah tallah" of the Malays, corrupted by them to "Oola tallo." Yet when questioned on the fubject, they affert their ancestors knowledge of a deity; though their thoughts were never employed about him; but this evidently means no more, than that their forefathers, as well as themselves, had heard of the Allah of the Mahometans (Allah orang Islaem).

They use, both in Rejang and Passummab, the word " dezway," to ex- Idea of invision press a superior, invisible class of beings; but each country acknowledges. it to be of foreign derivation, and they suppose it Javanese. Raddeen, of Madura; an ifland close to Java; who is well conversant with the religious opinions of most nations, afferted to me that " deway" or " deevab," was an original word of that country, for a superior being, which the interior Javans believed in; but that they used no ceremonies or forms of worship: that they had some idea of a future life, but not as a state of retribution; conceiving immortality to be the lot of rich, rather than of good men. I recollect that an inhabitant of one of the islands farther eastward, observed to me, with great simplicity, that great men only went to the fkies; how fhould poor men find admittance there? The Sumatrans, where untinctured by Mahometanism, do not appear to have any notion of a future state. Their conception of virtue or vice, extends no farther than to the immediate effect of actions, to the benefit or prejudice of fociety, and all fuch as tend not to either of these ends, are, in their estimation, perfectly indifferent.

Notwithstanding what is afferted of the originality of the word " deway" or " dewah," I cannot help remarking its extreme affinity to the Persian word " deeco," which fignifies " an evil spirit" or " bad genius," and is called in our translation " dive." Perhaps, long antece-

dent to the introduction of the faith of the Calipbs, among the eastern people, this word might have found its way, and been naturalized in the islands; or perhaps its progress was in a contrary direction. It has likewise a connexion in sound, with the names used to express a deity, or some degree of superior being, by many other people of this region of the earth. The Battas; inhabitants of the northern end of Sumatra, whom I shall describe hereafter; use the word "daibattah" or "daivattah;" the Chingalese, of Ceylon, dewijoo; the Biadjoos of Borneo, dewattah; the Papooas of New Guinea, 'wat; and the Pampangos, of the Philippines, dinata. It bears likewise an affinity (doubt-less accidental) to the Deus of the Romans.

Veneration for the manes and tombs of their ancestors. The fuperstition which has the strongest influence on the minds of the Sumatrans, and which approaches the nearest to a species of religion, is that which leads them to venerate, almost to the point of worshipping, the tombs and manes of their deceased ancestors (nennay pooyang). These they are attached to as strongly as to life itself, and to oblige them to remove from the neighbourhood of their crammat (cimetieres), is like tearing up a tree by the roots. These, the more genuine country people regard chiesly, when they take a solemn oath, and to these they apostrophize in instances of sudden calamity. Had they the art of making images, or other representations of them, they would be perfect lares, penates, or household gods. It has been afferted to me, that in very ancient times, the Sumatrans made a practice of burning the bodies of their dead, but I could never find any traces of the custom, or any circumstances that corroborated it.

Metempfy-

They have an imperfect notion of a Metempsychosis, but not in any degree systematic, and I doubt its having any original connexion with the doctrines of the *Hindoos*. Popular stories will often prevail, and be generally received, of such a particular man being changed into a tiger, or other beast. They think indeed that tigers in general are actuated with the spirits of departed men, and no consideration will prevail on a countryman, to catch or to wound one, but in self defence, or immediately

ately after the act of destroying a friend or relation. They speak of them with a degree of awe, and hefitate to call them by their common name (reemow, or machang), but rather, with a degree of tenderness, their nennay (ancestors), or setue, (the old people); as really believing them fuch, or by way of foothing or coaxing them; as our ignorant country folk call the fairies, " the good people." When an European procures traps to be fet, by the means of persons less superstitious, those have been known to go at night to the place, and practice fome forms, in order to persuade the animal, when caught, or when he shall perceive the bait, that it was not laid by them, or with their confent. They talk of a place in the country where the tigers have a court, and maintain a regular form of government, in towns, the houses of which are thatched with women's hair. It happened that in one month, feven or eight people were killed, by these prowling beasts, in Manna district; upon which a report became current, that fifteen hundred of them were come down from Passummah; of which number, four were without understanding (geelo), and having separated from the rest, ran about the country occafioning all the mischief that was felt. The Aligators, almost equally destructive, owing to the constant practice of bathing in the rivers, are regarded with nearly the fame degree of religious terror. Fear is the father of superstition, by ignorance. These two animals prove the Sumatran's greatest scourge. The mischief the former commit, is incredible, whole villages being often depopulated by them. The people learn to reverence, as supernatural effects, the furious ravages of an enemy they have not resolution to oppose.

In fome parts likewise; but chiefly to the fouthward; they superfitiously believe, that certain trees, particularly those of a venerable appearance (as an old jawee jawee or banian tree) are the refidence, or rather the material frame of spirits of the woods: an opinion which exactly answers to the idea entertained by the ancients, of the dryades and hamadryades. At Bencoonat, in the Lampoon country, there is a long stone. flanding on a flat one, supposed by the people to possess extraordinary Ttt

Superstitious

power

power or virtue. It is reported to have been once thrown down into the water, and to have raifed itself again, to its original position; agitating the elements at the same time with a prodigious florm. To approach it without respect, they believe to be the source of missfortune to the offender.

The inland people of that country, are faid to pay a kind of adoration to the fea, and to make to it an offering of cakes and fweetmeats (joada), on their beholding it for the first time, deprecating its power of doing them mischief. This is by no means surprizing, when we consider the natural proneness of unenlightened mankind, to regard with fuperstitious awe, whatever has the power of injuring them without controul, and particularly when it is attended with any circumstances. mysterious and inexplicable to their understandings. The sea possesses all these qualities. Its destructive and irrefishible power is often felt, and especially on the coasts of India, where tremendous surfs are constantly breaking on the shore, rifing often to their greatest degree of violence, without any apparent external cause. Add to this, the flux and reflux. and perpetual ordinary motion of that element; wonderful even to philosophers who are acquainted with the cause; unaccountable to ignorant men, though long accustomed to the effects; but to those who only once or twice in their lives, have been eye witneffes to the phænomena, supernatural and divine. It must not however be understood, that any thing like a regular worship is paid to the sea, by these people, any more than we should conclude, that people in England worship witches, when they nail a horse-shoe on the threshold, to prevent their approach, or break the bottoms of egg fhells, to hinder them from failing in them. It is with the inhabitants of Lampoon, no more than a temporary sentiment of fear and respect, which a little familiarity soon effaces. Many of them, indeed, imagine it endowed with a principle of voluntary motion. They tell a story of an ignorant fellow, who obferving with aftonishment its continual agitation, carried a vessel of sea water with him, on his return to the country, and poured it into a lake,

in full expectation of feeing it perform the fame fanciful motions, he had admired it for, in its native bed.*

The

* The manners of the natives of the Philippine or Luzon islands correspond in so many firiking particulars with those of the inland Sumatrans, and especially where they differ most from the Malays, that I think no doubt can be entertained, if not of a fameness of origin, at least of an intercourfe and connexion in former times, which now no longer exists. The following instances are taken from an effay preferved by Thevenothus, entitled Relation des Philipines par un religieux; traduit d'un manuscrit Espagnol du cabinet de Mons. Dom. Carlo del Pezzo; (without date) and from a manuscript communicated to me by Alex. Dalrymple, Esq. " The chief Deity of the Toralas is called Bathala mei Capal, and also Dinata; and their principal idolatry confilts in adoring those of their ancestors, who fignalized themselves for courage or abilities; calling them Humalagar, i. e. manes. They make flaves of people who do not keep filence at the tombs of their ancestors. They have great veneration for the crocadile, which they call nono, fignifying grandfather, and make offerings to it. Every old tree they took upon as a fuperior being, and think it a crime to cut it down. They worship also stones, rocks, and points of land, shooting arrows at these last as they pass them. They have priests, who, at their facrifices, make many contorfions and grimaces, as if poffessed with a devil. The first man and woman, they say, were produced from a bamboo, which burst in the island of Sumatra; and they quarreled about their marriage. The people mark their bodies in various figures, and render them of the color of ashes: have large holes in their ears: blacken and file their teeth, and make an opening which they fill up with gold: they used to write from top to bottom, till the Spaniards taught them to write from left to right: bamboos and palm leaves serve them for paper. They cover their houses with ftraw, leaves of trees, or bamboos split in two, which serve for tiles. They hire people to fing and weep at their funerals; burn benjamin; bury their dead on the third day in firong coffins; and fometimes kill flaves to accompany their deceafed mafters."

The latter account is more particular, and appears of modern date.

These Indians have no custom of perpetuating the names of families; but on the birth of a child, the mothers named it from some accidental circumstance, as Malivag, or difficult, because the birth was such; Malaccas or strong, because it appeared to be a strong child: and at other times they gave them the first name that occurred, as Daan, a road. These names continued until the children were grown up and married, and then the son or daughter gave a surname to their parents. Others, who had no children, invited their relations and acquaintance to an entertainment, when they received another name or appellation, called pamagat, sounded, by some metaphor, on their first name; as when this was Bacal, or iron, the pamagat would be Dimatanassan, or he that cannot be destroyed by time; Bayani, or valiant, they surnamed Dimalapitan, he whom no one dares attack. It was a custom also amongst them to call one another by correlative names, sounded on some particular transaction; as if one had given another a sweet basis, these called each other Casolass, which is the name of the thing given.

The Sumatrans are firmly perfuaded that various particular perfons, are, what they term "betooah" (facred, impaffive, invulnerable, not liable

The exceffive indolence and supineness of this people, is evident from their having no written account of their religion, government, or history. All their knowledge therein was founded on tradition, or handed from father to fon in fongs, which they repeat in their voyages, feafts, and funerals. In these ballads are related the fabulous genealogy and deeds of their gods and great men. Superior to the rest of their deities, they worshipped one whom the Tagalas called Bathala Meycapal, which fignifies God the Maker. They adored also the fun, moon, and rainbow, and different kinds of animals and birds. They reverenced a blue bird of the fize of a starling, to which also they attributed the name of Bathala, and adored the crow, calling it Meylupa, or lord of the earth; they held the caiman, or aligator, in great reverence, and when they faw him they called him nono, or grandfather, praying with great tenderness that he would do them no harm, and to this end, offered him of whatever they had in their boats, throwing it into the water. There was not an old tree to which they did not offer divine worship, especially that called balete; and even at this time they have fome respect for them. Beside these they had certain idols inherited from their ancestors, which the Tagalas called Anito, and the Bisayans, Divata. Some of these were for the mountains and plains, and they asked their leave when they would pass them: others for the corn fields, and to these they recommend them, that they might be fertile, placing meat and drink in the fields for the use of the Anitos. There was one, of the fea, who had care of their fishing and navigation; another of the house, whose favor they implored at the birth of a child, and under whose protection they placed it. They made Anitos also of their deceased ancestors, and to these were their first invocations in all difficulties and dangers. They reckoned amongst these beings, all those who were killed by lightning or aligators, or had any difastrous death, and believed that they were carried up to the happy state, by the rainbow, which they call Balan-gao. In general they endeavored to attribute this kind of divinity, to their fathers, when they died in years, and the old men, vain with this barbarous notion, affected in their fickness a gravity and composure of mind, as they conceived, more than human, because they thought themselves commencing Anitos. They were to be interred at places marked out by themselves, that they might be discovered at a distance and worshipped. The Missionaries have had great trouble in demolishing their tombs and idols, but the Indians, inland, still continue the custom of pasing tabis fa none, or asking permission of their dead ancestors, when they enter any wood, mountain, or corn field, for hunting or fowing; and if they omit this ceremony, imagine their nonos will punish them with bad fortune. They had no temples or places of worship, but the idols were placed in their houses, or some cave, or like place, with a pan of incense burning before them; but they had great numbers of priests and priestesses, which the Tagalas called Catolonan, and the Bisayans, Babaylan. Their facrifices had different ceremonies, agreeable to the occasion of making them. If it was in compliment to any of their chiefs, they called it, for greater oftentation, the feast of Bathala Meycapal, and they raised an arbour before the house, ornamented with different colored cloths, in which the guests assembled, and the Catolonan or priesters ordered a girl of the best appearance among them, to kill the animal, which was brought for this purpose; accompanied with music and dancing. The beast being killed,

liable to accident); and this quality they fometimes extend to things inanimate; as ships and boats. Such an opinion, which we should suppose

was dreffed and divided amongst them; with several other dishes, after their use; but this was the most esteemed, and eaten with great reverence and respect. The ceremony concluded with copious libations, and fongs. If the facrifice was made for a fick person, the priest ordered a new house or arbour to be built at his expence, capable of celebrating it, and removed him this ther. They brought the facrifice near him, which was fometimes a flave, but most commonly fome land animal or fea turtle, and having placed him on a mat, with feveral diffies of meat round him, the priestess dancing about him with little bells, wounded the animal, and anointed the man with its blood; after which they drew it aside, and the priestess muttering certain words, opened it, and examined the entrails with great care : then difforting her features, and making uncommon motions with her feet and hands, and foaming at the mouth, she pretended for some time to be in an extafy: when she came to herfelf, she foretold the fate of the fick man. If she prophefied his recovery, they fell to eating, drinking, and finging the history of his ancestors. and the praise of his Anito; but when his death was foretold, the priestess foothed the bad news with a recital of the virtues and valor of the fick person, whom, she faid, the Anitos had chosen to be one of themselves, and immediately recommended herself and all the family, that he might remember them in his new state; and from thence forward she obliged his friends to treat and regard him as an Anito. The whole ended with eating the most delicious parts of the facrifice. Those who were present, usually gave some gratuity of gold, cottons, or other things, according to their abilities; which were for the prieft or prieftefs who ministered the facrifice; fo that they were generally well dreffed, and wore jewels and other ornaments : but notwithstanding this, at other times they were little reputed or effecmed amongst the Indians, who looked on them as drones who lived by the labor of others.

Their notions of the creation of the world, and formation of makind, had something ridiculously extravagant. They believed that the world at first consisted only of sky and water, and between these two, a Glede; which weary with slying about, and finding no place to rest, set the water at variance with the sky, which, in order to keep it in bounds, and that it should not get uppermost, loaded the water with a number of islands, in which the Glede might settle and leave them at peace. Mankind, they said, sprung out of a large cane with two joints, that sloating about in the water, was at length thrown by the waves against the feet of the Glede, as it stood on the shore, which opened it with its bill, and the man came out of one joint, and the woman out the other. These were soon after married by consent of their God, Bathala Meycapal, which caused the sirst trembling of the earth; and from hence are descended the different nations of the world.

The foregoing description does not belong to the barbarous and savage race of people, living in the mountains, who are of the color and size of the Hottentots of the Cape of Good Hope: like them they have short twisted hair, and daub their bodies all over with grease and ashes: their only clothing is made of the rind of trees with which they cover their middle, besides some bracelets

U u u curiously

pole every man might have an opportunity of bringing to the telt of truth, affords a humiliating proof of the weakness and credulity of human nature, and the fallibility of testimony, when a film of prejudice obscures the light of the understanding. I have known two men, whose honesty, good faith, and reasonableness in the general concerns of life . were well established, and whose affertions would have weight in transactions of confequence: these men, I have heard maintain, with the most deliberate considence, and an appearance of inward conviction of their own fincerity, that they had more than once, in the course of their wars, attempted to run their weapons into the naked body of their adversary, which they found impenetrable; their points being continually and miraculously turned, without any effort on the part of the orang betogah: and that hundreds of instances, of the like nature, where the invulnerable man did not possess the smallest natural means of opposition. had come within their observation. An English officer, with more courage and humor, than discretion, exposed one imposture of this kind. A man having boafted in his prefence, that he was endowed with this fupernatural priviledge, the officer took an opportunity of applying to his arm, the point of a fword, and drew the blood; to the no little di-

curiously made of rattans; and for marks of distinction they have garlands composed of feathers. Their weapons are bows and arrows, and a large thick knife. In some respects they resemble the favages of North America, for their greatest ambition is to drink out of the skulls of their enemies. after having fealped them. They live mostly on fruits, and roots, in the woods, and when they meet with any game they make a feaft, and after tiring themselves with dancing, sleep together in heaps, like brutes, in the open air. They have neither letters, laws, nor other government, than that every family is subject to it's head, and their only care is to defend their districts, about which they have frequent and bloody wars. Formerly, as natural lords of the country, they obliged the people who fettled in the low lands, to pay them a tribute for the use of the woods and rivers. In different parts of the island they have different names, but the Spaniards in general call them Negritos del monte, some of them being as black as the natives of Guinea, particularly in the Isla de Negros. It is believed that they were the original inhabitants of the islands, but it is a matter of fome difficulty to discover from whence this race, so different in color and customs from all the neighbouring people, could proceed; if it is not allowed that their different aliment, and being continually exposed to the weather, would produce this effect. The more civilized nations before described, whom the Spaniards call the Indians, are a robust, well made people, fair, but inclined to copper color, with flattish noses, black eyes and hair, and a guilbole version

version of the spectators, and mortification of the pretender to superior gifts, who vowed revenge, and would have taken it, had not means been used to keep him at a distance. But a single detection of charlatanerie, is not effectual to deftroy a prevalent superstition. These impostors are usually found among the Malays, and not the more fimple country people.

No attempts, I have reason to think, have ever been made by mif- No Missionafionaries, or others, to convert the inhabitants of the island to Christi-ries. anity, and I have much doubt, whether the most zealous and able would meet with any permanent fuccess in this pious work. Of the many thousands baptized in the eastern islands, by the celebrated Francis Xavier, in the fixteenth century, not one of their descendants are now found to retain a ray of the light imparted to them; and probably, as it was and be similar novelty only, and not conviction, that induced the original converts to embrace a new faith, the impression lasted no longer than the sentiment which recommended it, and disappeared as rapidly as the itinerant apostle. Portugueze and Christians are confounded, in the Malay language under the fame general name, the former being called " orang Zerani," by corruption for " Nazerani." This neglect of missions to Sumatra, is one cause that the country has been so little known to the civilized mountains. That division of Acapton which is included by Padenthlrow ches, and a place called Mally is diffinguished by the name of Bravens.

and from theme fouthward to Flat-point, by that of Lacat-Lawson;

The country of Lamper is bed inhabited in the central and mount

?alabicants.

The country of Lampoon and its inhabitants—Language—Government—Wars—Peculiar customs—Religion.

Having thus far spoken of the manners and customs of the Rejangs more especially, and adverted, as occasion served, to those of the Passummab people, who nearly resemble them, I shall now present a cursory view of those circumstances in which the inhabitants of the Lampoon country differ from them; though this diffimilitude is not very conderable.

Limits of the Lampoon dountry. By the Lampoon country is understood, a portion of the southern extreme of the island, beginning, on the west coast, at the river of Padanggoochie, which divides it from Passummah, and extending across as far Palembang, on the north east side, at which last place the settlers are mostly Javans. On the south and east sides, it is washed by the sea, having several ports in the straits of Sunda, particularly Keysers and Lampoon bays; and the great river, Tallong bouang, runs through the heart of it, rising from a considerable lake (ranou) between the ranges of mountains. That division of Lampoon which is included by Padang-goochie, and a place called Nassall, is distinguished by the name of Briuran, and from thence southward to Flat-point, by that of Laout-cawoor; although Cawoor, properly so called, lies in the northern division.

Inhabitants.

The country of Lampoon is best inhabited in the central and mountainous parts, where the people live independent, and in some measure secure from the inroads of their eastern neighbours, the Javans, who, from about Palembang and the straits, frequently attempt to molest them. It is probably within but a very sew centuries, that the southwest coast of this country has been the habitation of any considerable number of people; and it has been still less visited by strangers, owing the unsheltered nature of the sea thereabouts, and want of soundings, in general, which renders the navigation wild and dangerous for country wessels;

veffels; and to the rivers being small and rapid, with shallow bars, and almost ever a high furf. If you ask the Lampoon people of these parts. where they originally came from; they answer, from the hills, and point out an inland place near the great lake, from whence, they fay, their forefathers emigrated; and further than this it is impossible to trace. They, of all the Sumatrans, have the strongest resemblance to the Chinese, particularly in the roundness of face, and constructure of the eyes. They are also the fairest people of the island, and the women are the tallest, and esteemed the most handsome.

Their language differs confiderably from that of the Rejangs, and Language. the characters they use are peculiar to themselves; as may be observed in the specimens exhibited.

The titles of government are Pangeran (from the Javans), Careeoo, Government and Kiddimong or Nebeebee; the latter nearly answering to dupatty among the Rejangs. The district of Croce, near Mount Poogong, is governed by five head men, called Pangow-leemo, and a fixth, superior, called by way of eminence, Pangow; but their authority is faid to be usurped, and is often disputed. The word, in common, fignifies a gladiator or prize fighter. The pangeran of Sooko, in the hills, is computed to have four or five thousand dependants, and sometimes, on going a journey, he levies a tallee, or eighth part of a dollar, on each family; which shews his authority to be more arbitrary, and probably more strictly feudal, than among the Rejangs, where the government is rather patriarchal. This difference has doubtless its source in the wars and invasions to which the former people are exposed.

The Javenese banditti, as has been observed, often advance into the Wars country, and commit depredations on the inhabitants, who are not, in general, a match for them. They do not make use of fire arms, though in the northern part of the island they are manufactured. Befide the common weapons of the country, they fight with a long lance, which is carried by three men; the foremost guiding the point, and covering Xxx himfelf

himself and his companions with a large shield. A compact body, thus armed, would have been a counter part of the *Macedonian* phalanx; but can prove, I should apprehend, of but little use among a people, with whom war is carried on in a defultory manner, and more in the way of ambuscade, than of general engagement, in which alone troops so armed could act with effect.

Inland of Samanka, in the Straits of Sunda, there is a diffrict, fay the Lampoons, inhabited by a ferocious people, who are a terror to the neighbouring country. Their mode of attoning for offences against their own community, is by bringing to their doofoon the heads of strangers. The account may be true, but without further authentication, such stories are not to be too implicitly credited, on the faith of a people who are fond of the marvellous, and addicted to exaggeration.*

Manners.

The manners of the Lampoons are more free, or rather licentious, than those of any other native Sumatrans. An extraordinary liberty of intercourse is allowed between the young people of different sexes, and the loss of female chastity, is not a very uncommon consequence. The offence is there, however, thought more lightly of, and inflead of punishing the parties, as in Passummab and elsewhere, they prudently endeavor to conclude a legal match between them. But if this is not effected, the lady still continues to wear the infignia of virginity, the fillet and armrings, and takes her place as fuch, at festivals. It is not only on these public occasions, that the young men and women have opportunities of forming arrangements, as in most other parts of the island. They frequently affociate together at other times; and the former are feen gallantly reclining in the maiden's lap, whifpering foft nonfense, whilst she adjusts and perfumes his hair, or does a friendly office, of less delicacy to an European apprehention. At bimbangs, the women often put on their dancing drefs, in the public hall, letting that garment

^{*} Till within a few years the Lampoon people believed the inhabitants of the island Enganos to be all females, who were impregnated by the wind; like the marcs in Virgil's georgic's. They styled them, in the Malay language, Ana Saytan, or imps of the devil.

Which

which they mean to lay afide, dexteroufly drop from under, as the other paffes over the head; but fometimes, with an air of coquetry, difplaying, as if by chance, enough to warm youthful imaginations. Both men and women anoint themselves before company, when they prepare to dance; the women, their necks and arms, and the men, their breafts. They also paint each others faces; not, seemingly, with a view of heightening, or imitating the natural charms, but merely as matter of fashion; making fantastic spots with the finger, on the forehead, temples, and cheeks, of white, red, yellow, and other hues. A brafs falver (tallam) covered with little china cups, containing a variety of paints, is ferved up for this purpofe.

Inftances have happened; though rarely; of very difagreable conclufions to bimbangs here. A party of reefows amongst the young fellows. have been known fuddenly to extinguish the lights, for the purpose of robbing the girls, not of their chaftity, as might be apprehended, but of the gold and filver ornaments of their persons. An outrage of this nature, I imagine could only happen in Lampson, where their vicinity to Java, affords the culprits eafier and furer means of escape, than in the central parts of the island: and here too their companies appear to be more mixed, collected from greater distances, and not composed, as with the Rejang people, of a neighbourly affemblage of the old men of a few contiguous doofoons, with their fons and daughters, for the fake of convivial mirth; of celebrating a particular domestic event; and promoting attachments and courtfhips amongst the young people.

In every doofoon there is appointed a youth, well fitted by nature and Particular cufeducation for the office, who acts as mafter of the ceremonies at their toms. public meetings, arranges the young men and women in their proper places, makes choice of the partners, and regulates all other circumstances of the affembly, except the important oconomy of the festival part or cheer, which comes under the cognizance of one of the elders. Both parts of the entertainment are preceded by long, complimentary speeches, delivered by the respective stewards, who, in return, are answered and complimented.

complimented on their skill, liberality, and other qualities, by some of the best bred amongst the guests. Though the manner of conducting, and the appendages of the Lampoon feasts, are superior in style, to the rustic hospitality of some of the northern countries; yet they are esteemed to be much behind these, in the goodness and mode of dreffing their food. The Lampoons eat almost all kinds of flesh, indiscriminately, and their goolies (curries or made diffies) are faid, by connoisseurs, to have no flavor. They ferve up the rice, divided into portions for each perfon; contrary to the practice in the other countries; the tallam being covered with a handsome, crimson napkin, manufactured for that use. They are wont to entertain strangers with much more profusion, than is met with in the rest of the island. If the guest is of any consequence, they do not hefitate to kill; befide goats and fowls; a buffaloe, or feveral, according to the period of his flay, and the number of his attendants. One man has been known to entertain a person of rank and his fuite, for fixteen days, during which time there were not less than an hundred diffies of rice spread each day, containing, some one, some two bamboos. They have dishes here, of a species of china or earthen ware, called "battoo benouang," brought from the eastward; remarkably heavy, and very dear; fome of them being valued at forty dollars apiece. The breaking one of them, is a family loss of no small importance.

Reception of

Abundantly more ceremony is used among these people, at interviews with strangers, than takes place in the countries adjacent to them. Not only the chief person of a party travelling, but every one of his attendants, is obliged, upon arriving at a town, to give a formal account of their business, or occasion of coming that way. When the head man of the doosoon is acquainted by the stranger with the motives of his journey, he repeats the speech at full length, before he gives an answer; and if it is a person of great consequence, the words must pass through two or three mouths, before they are supposed to come with sufficient ceremony to his ears. This in fact has more the air of adding to his own importance and dignity, than to that of the guest; but it is not in Sumatra alone, that respect is manifested by this seeming contradiction.

The terms of the joojoor, or equivalent for wives, is the same here, Marriages, nearly, as with the Rejangs. The creefe-head is not effential to the bargain, as among the people of Passummab. The father of the girl never admits of the pootoofe tallee kooloo, or whole fum being paid, and thereby withholds from the husband, in any case, the right of selling his wife, who, in the event of a divorce, returns to her relations. Where th pootoofe tallee is allowed to take place, he has a property in her, little differing from that of a flave, as formerly observed. The particular fums which conftitute the joojoor, are lefs complex here, than at other places. The value of the maiden's golden trinkets is nicely estimated, and her joojoor regulated according to that, and the rank of her parents. The femundo marriage scarce ever takes place but among poor people, where there is no property on either fide, or in the case of a slip in the conduct of the female, when the friends are glad to make up a match in this way, instead of demanding a price for her. Instances have occurred, however, of countrymen of rank affecting a femundo marriage, in order to imitate the Malay manners; but it has been looked upon as improper, and liable to create confusion.

The fines and compensation for murder, are in every respect the same, as in the countries already defcribed.

The Mahometan religion has made confiderable progress amongst the Religion. Lampoons, and most of their villages have mosques in them: yet an attachment to the original superstitions of the country, induces them to regard with particular veneration the crammats, or burying places of their fathers, which they pioufly adorn, and cover in from the weather.

car'ers is faild to y v v derived from the words car-

is a very fabulous air, of a famous engagement on that ipot, between

, and there others. Here they collect large acanticles of gold.

Malay governments—Empire of Menangcabow—Extent of the Sultan's ancient and present power—His titles—Literature and Arts among st the people—Period of conversion to Mahometanism—General acceptation of the word Malay—Constitution of their states—Bencoolen—Indrapour—Anac Soongey—Palembang—Yambee, &c.

Malays.

I SHALL now take a view of the Malay governments, as diffinguished from those of the more genuine Sumatrans, who, by the Malays, are named orang ooloo, or countrymen, and sometimes, orang doofoon, from their residing in villages so called.

Empire of Menangeabow.

The principal feat of empire of the Malays, and of the whole island, is Menangcabow. This lies near the center, extending partly to the northward, but chiefly to the fouthward of the equinoctial, about fixty or an hundred miles. Such are the limits that now confine a monarchy, whose jurisdiction formerly comprehended all Sumatra, and whose sovereign was talked of with respect in the farthest parts of the east. The country is, generally speaking, a large plain, bounded by hills, clear of woods, and, comparatively, well cultivated. It has an easy communication with both fides of the ifland, lying nearer to the western coast, but having the advantage, to the east, of the large rivers, Racan, Indergerce, Siak, Jambee, and even Palembang, with which it is said to have connexion, by means of a lake, that gives fource to the two last, as well as to the river of Cattown on the opposite side. Colonies of Malays from Menangcabow, are settled on several branches of Jambee river, or rather those small rivers which run into it, of Lemoon, Batang Asy, Pacallangjamboo, and some others. Here they collect large quantities of gold.

The name of Menangcahow is faid to be derived from the words "menang", to win, and "cartow," a buffaloe; from a story, which carries a very fabulous air, of a famous engagement on that spot, between the

the buffaloes and tigers; in which the former are reported to have acquired a complete victory. Such is the account the natives give; but they are fond of dealing in fiction, and I am aut to suppose, that the etymology has no better foundation than a fanciful refemblance in the found *

The actual power and resources of the Sultan, are at this day, scarcely Power of the funerior to those of a common raja; yet he still afferts all his ancient rights and prerogatives; which are not disputed so long as he refrains from attempting to carry them into force. The kings of Ackeen, Indrapour, Moco Moco, Palembang and Jambee, acknowledge their authority to be derived from him, as their lord paramount, and some among them pay him a trifling complimentary tribute; acting, however, entirely inpendent of him. His character is held in a facred light, and the obfcurity and air of mystery which surround his court, together with the influence of the Mahometan priefts, who regard him as the head of their religion, keep up this veneration. In fhort, his authority not a little refembles that of the fovereign pontifs in Europe, some years back, founded as it is on superstitious opinion; holding terrors over the weak. and contemned by the strong. He attempts to effect, what arms alone can accomplish, by pompous, dictatorial edicts, which are received with outward demonstration of profound respect, but no further obeyed than may happen to be confiftent with the political interests of those princes to whom they are addressed. This empire is looked upon by the Sumatrans, to have subfifted from the remotest antiquity; but as they have no annals, records, or other historical documents, it is impossible to make even a guess as to its origin. There cannot be a doubt but that it is extremely ancient, having every internal evidence, and being acknowledged fuch by every tradition. When the Europeans first made discoveries in these parts, it was in its decline, as appears from the importance and independance, at that time, of the kings of Acheen, Pedeer and Palay, the

^{*} Some map-makers have placed the name of Manancaubo in the center of the peninfula of Malacca, instead of the island of Sumatra. remrof a gubli first about 11 28. " Walacca had the enither of swird given to it, on account

former of whom holds a grant under the Sultan of Menangcabow, of the fea coaft, as far fouthward as Bencoulog; though in 1613 his poffessions extended no farther than to Barroos, and his actual claim did not reach beyond Padang. All the early navigators who frequented this island; of whom the most intelligent and inquisitive was certainly the French commodore, Beaulieu, who arrived in 1620; speak of Menangcabow; either directly or indirectly; as a place of the greatest importance; particularly on account of the gold trade carried on, and almost monopolized by its inhabitants, and their supplying the neighbouring countries with creefes, fire arms and cloth. As they could have no immediate connexion with an inland power, and the princes with whom their commercial concerns lay, would not be forward to fet forth the confequence of another state, by a comparison with which their own must fuffer, the accounts which navigators give of this empire are obscure and imperfect, and but for the gold which flowed from it towards the fea coasts, it probably would have paffed unnoticed in the histories of their voyages. The commodore speaks of the kings of Acheen, Palembang, and Indrapour, as independent fovereigns, but as thefe avow the delegation of their authority from Menangcabow, it only proves that they had, by that period, shaken off their subjection to an empire, then declining from its meridian, and finking in the gulph of time.*

In

^{*} The following inftances have occurred to me, of mention made by writers, at different periods, of the kingdom of Menangeabow. Odoardus Barbofa, 1519. Ramulio. "Sumatra, a most large and beautiful island, Pedir the principal city; then Pacem, Achem, and Campar. Menangcabo in the center, which is the principal fountain of gold-Linschoeten, 1579. " At Manancabo, excellent poignands made, called creefes; best weapon in all the orient. Islands along the coast of Sumatra, called islands of Menancabo. You must run between the ilbas d'Ouro and the land. Put into the island called ilha d'Ouro, de Menancabo, a high and fair land."-Mendez de Pinto, 15,8. " Mentions foldiers of Menancabo in an army that invaded Acbem in 1539. Gold transported from Menancabo to the kingdom of Campar, on the waters of Jambee and Broteo"-Lançaster, 1602. " Menangcabo lies eight or ten leagues inland of Priaman"-Best. 1613. "A man arrived from Menangcaboo at Ticoo, and brought news from Jambee." _Beaulieu, 1622. "To the eastward of Padang lies the kingdom of Manincabo. The most powerful king of the aborogines refides between that place and Ticoo, being poffessed of the country that produces gold, which is trucked with the inhabitants of Manancaho, for rice, arms, and cloth."-De Barros: published about 1558. " Malacca had the epithet of aured given to it, on account of the

In later days, the influence of the Dutch, whose fettlement of Padang lies in the neighbourhood, has greatly contributed to the undermining the political confequence of its monarch, by giving countenance and support to his disobedient vassals: who, in their turn, have often experienced the dangerous effects of receiving favors from too powerful an ally. Rajah Canallee, who was his viceroy of Passamman, maintained a long war with the Hollanders, which was attended with many reverfes of fortune.

The titles and epithets assumed by the Sultans, in the preambles to His titles, their edicts and letters, are the most extravagantly absurd that it is posfible to imagine; furpaffing, in wildness and folly, the præternatural attributes of the Persian genii and dives. Many of them descend to mere childifiness; and it is difficult to conceive how any people, so far advanced in civilization, as to be able to write, could possibly display such evidences of barbarism. A specimen of a warrant of recent date, sent to Tooanco Soongey Pagoo, a high priest residing near Bencoolen, is as follows.

the abundance of gold carried thither from Menancabo and Barroos, countries in C, amatra"_ Herbert's travels: printed 1677. " Mediterranean town Manancabo, formerly called Syndo Ganda"-Argenfola, 1586. " Crizes made at Menangcabo, and cannon cast, many years before the Europeans arrived in the country."-Vies de Governeurs Generals Hollandois. " West Coast of Sumatra brought under subjection to the Dutch in 1664, by the sleet of Pierre de Bitter; from Sillebar to Barross. Padang fettlement established in 1667. The commandant of Padang is Stadbouder to the Emperor of Maningcabo. Revolts in the country in the years 1665, 1670, 1680, and 1713." Diogo de Couto, 1600. He gives an account of a Portuguese thip wrecked on the coast of Sumatra, near to the country of Manancabo, in 1560. Six hundred persons got on shore, among whom were some women, one of whom, Dona Francisca Sardinha. was of fuch remarkable beauty, that the people of the country refolved to carry her off, for their king; and they effected it, after a firuggle in which fixty of the Europeans loft their lives. At this period there was a great intercourse between Menangcabow and Malacca, many veffels going yearly with gold, to purchase cotton goods and other merchandize. In ancient times the country was fo rich in this metal, that feveral hundred weight (feis, fete, e mais candix, de que tres fazem bum moyo) used to be exported in one feason. Vol. 3. p. 278.

of a horse of the race of sorimborabnee, superior to all others; sultan of the burning mountain, and of the mountains goontang-goontang, which divide Palembang and Jambee; who may flay at pleasure, without being guilty of a crime; who is possessed of the elephant named Settee derva; who is vicegerent of heaven; fultan of the golden river; lord of the air and clouds; mafter of a balli, whose pillars are of the shrub jelattang; of gandangs (drums) made of hollowed branches of the minute shrubs pooloot and feelofooree; of the gong that refounds to the skies; of the buffaloe named Se Binnooang Sattee, whose horns are ten feet asunder; of the unconquered cock, Sengoonannee; of the coconut tree, whole amazing height, and being infested with serpents and other noxious reptiles, render it impossible to be climbed; of the flower named seeree menjeree, of ambrofial fcent; who, when he goes to fleep, wakes not till the gandang nobat founds; one of whose eyes is as the fun, and the other as the moon. To his subjects declares this his will, &c." * Probably

* The following Letter from the fultan of Menangeabow to the father of the present sultan of Moco Moco, and apparently written about sifty years ago, was communicated to me by Alexander Dalrymple, Esq. and though it is in part a repetition, I esteem it too curious to hesitate about inserting it. The sile is much more rational than that of the foregoing.

"Praifed be Almighty God! Sultan Gaggar Allum the great and noble King, whose extensive power reacheth unto the limits of the wide ocean; unto whom God grants whatever he defires, and over whom no evil spirit, nor even Satan himself has any influence; who is invested with an authority to punish evil doers; and has the most tender heart in the support of the innocent; has no malice in his mind, but preserveth the righteous with the greatest reverence, and nourisheth the poor and needy, feeding them daily from his own table. His authority reacheth over the whole universe, and his candour and goodness is known to all men. (Mention made of the three brothers.) The embaffador of God and his prophet Mahomet; the beloved of mankind; and ruler of the island called Percho. At the time God made the heavens, the earth, the fun, the moon, and even before Evil Spirits were created, this fultan Gaggar Allum had his refidence in the clouds; but when the world was habitable, God gave him a bird called Hocines, that had the gift of speech; this he fent down on earth, to look out for a spot where he might establish an inheritance, and the first place he alighted upon was the fertile island of Lancapore, fituated between Palimban and Jambee, and from thence fprang the famous kingdom of Manancabou, which will be renowned and mighty until the Judgment Day. I ad a silde of the 2 walked outline and at a place called the " field of fibeep," that they may not have occasion to be athemed at their

"This Maha Rajah Doorja is bleffed with a long life, and an uninterrupted course of prosperity, which he will maintain in the name, and through the grace of the holy prophet, to the end that God's

Probably no records upon earth, can furnish an example of more unintelligible jargon: yet these attributes are believed to be indisputable tably

God's divine Will may be fulfilled upon earth. He is endowed with the highest abilities, and the most profound wisdom and circumspection in the governing the many tributary kings and fubjects. He is righteous and charitable, and preserveth the honor and glory of his ancestors. His justice and clemency are felt in distant regions, and his name will be revered until the last day. When he openeth his mouth he is full of goodness, and his words are as grateful as rose water to the thirfly. His breath is like the foft wind of the heavens (Janatecool Ferdoors), and his lips are the instruments of truth; fending forth perfumes more delightful than benjamin or myrrh. His nostrils breathe ambergrease and musk; and his countenance has the lustre of diamonds. He is dreadful in battle, and not to be conquered, his courage and valor being matchless. He, the fultan Maha Rajah Doorja, was crowned with a facred crown from God; and poffesses the wood called Kamat, in conjunction with the emperors of Rome and China. He is the fultan that keeps the cloth called Sanfifia Kallah, which weaves itself, and adds one thread yearly of fine pearls; and when that cloth shall be finished, the world will be no more. He also possesses the tree Negataroona, and a kind of gold called Jatta Jattee, which is fo heavy that a small lump will fnap the Datté wood. This is the fultan that enjoys the fword Se Mandang Gerey, which has one hundred and ninety wide notches in the field of battle, and is the weapon that killed the spirit of Kattee Moone; the dagger known by the name of Hangin Singa is also his, and will, at his command, fight of itself, with which he has vanquished many nations. He also possesses the lance Lambing Lamboora, the blade of which, called Segar, was given him by an inhabitant of the fea. He likewife has horfes of infinite strength and courage; and mountains of spontaneous fire. This is the fultan who keeps the flower Champaka that is blue, and to be found in no other country but his (being yellow elfewhere). He poffeffes the fhrub Sera Mangeree, and the reed Arver Priendue, to which birds of all countries come at the time of their death. He has also drums made of the tree Silagooree, and another inflrument of the like nature of the wood called Paoloot-pooloot, which fend their found through his whole dominions whenever they are beat-He has a Bechar house built of the hallowed wood Jylatong, and each beam in it, though strong and large, is yet as light as bamboo. He also possesses a carpet made of grass, and a lump of gold in the shape of a man, given him by a God of the woods.

After this falutation, and the information I have given of my greatures and power, which I attribute to the good and holy prophet Mahomet, I am to acquaint you with the commands of the fultan whose presence bringeth death to all who attempt to approach him without permission; and also those of the sultan of Indrapore who has four breasts. This friendly sheet of paper is brought from the two sultans above named, by their bird Ongas, unto their son, sultan Gondam Shab, to acquaint him with their intention, under this great seal, which is, that they order their son sultan Gondam Shab to oblige the English Company to settle in the district called Biangnoor, at a place called the "field of sheep," that they may not have occasion to be assumed at their frequent resultant of our goodness, in permitting them to trade with us and with our subjects; and that in case he cannot succeed in this affair, we hereby advise him, that the ties of friendship substisting

tably true, by the Malay's refiding at a diffance from his immediate dominions, who possess a greater degree of faith than wit; and with this addition, that he dwells in a palace without covering, free from inconvenience.

The feals prefixed to his warrant, befide his own, are those of the Sultan of Rome, or Grand Signior, (the empire of the Romans having been transferred to Constantinople) who is looked upon, since the ruin of the Caliphs, as the head of the Mahometan religion, and whom he honors with the title of his eldest brother; and of the Sultan of China; a kingdom well known throughout the eastern seas, and by the Malays called Negree Cheeno; whom he styles his second brother; modestly regarding himself as the youngest. This gives a picture of the conception these monarchs formed of their relative importance in the world, and shews the extent, if not the accuracy, of their geographical and historical knowledge.

Ceremonies.

The royal falute, is one gun; which is a refinement in ceremony. As no number could be supposed to convey an adequate idea of respect, but must, on the contrary, establish a definite proportion between his dignity, and that of his nobles, or of other princes; the Sultan of Menancabow chuses to leave the measure of his importance indefinite, by this policy—and save his gunpowder. It must be observed, that the Malays are in general extremely fond of the parade of siring cannon, which they never neglect on high days, and on the appearance of the new moon; particularly that which marks the commencement of their posasso, or annual sast. Yellow being esteemed a royal color, is said to be constantly, and exclusively, worn by the Sultan and his court. His usual present on sending an embassy; for no Sumatran has an idea of

fublishing between us and our fon, are broken; and we direct that he fend us an answer immediately, that we may know the result, and take our measures accordingly—for all this island is our own."

It is difficult to determine, whether the preamble, or the subject of the letter, be the more extraordinary.

making

making a formal address, on any occasion, without a present in hand, be it never so trisling; is a pair or more of white horses; being emblematic of the purity of his character and intentions. The relations of the royal family; and many who have no pretensions to it, assume that distinction; are treated, wherever they appear, not only with the most extreme respect, but in some parts of the island, independent in other points, with such a degree of superstitious veneration, that the country people submit to be insulted, plundered, and even wounded by them, without making resistance, which they would esteem a dangerous profanation, amounting to sacrilege*.

Literature.

Like the other people of Sumatra, those of Menangcabow are entirely without records or annals: none such, at least, have ever been spoken of in the various negociations we have had with them. They are expert at writing, in the Arabic character, but their literature amounts to nothing more, than transcripts of the koraan, and cabar or historic tales, resembling our old romances, but having less ingenuity. Songs, called pantoon, before mentioned, they are famous for composing. These spread throughout the island, and though they are likewise invented in many other parts, are held in the first esteem, as coming from the Muses most favored seat.

Arts.

The arts in general are carried, among them, to a greater degree of perfection, than in other parts of Sumatra. The Malays are the fole

this rolley and fave his gunpowder. It must be observed, that the

fabricators

^{*} A man of this discription, who called himself Jeanderpatooan Siri Hamet Shah, heir to the empire of Menangcabow, in consequence of some differences with the Dutch, came and settled among the English at Benevolon in the year 1687, on his return from a journey as far as Lampoon; and being much respected by the country people, he gained the entire considence of Mr. Bloom, then governor. He subdued some of the neighbouring chiefs who were disaffected to the English, particularly Raja Moodo of Soongey lamo, and also a Jennang (lieutanant) from the king Bantam: he coined money, called petees; established a market; and wrote a letter to the Company, promising to put them in possession of the trade of the whole island. But shortly afterwards, a discovery was made of his having formed a design to cut off the settlement, and he was in consequence driven from the place. The records mention, at a subsequent period, that the sultan of Indrapour was raising troops to oppose him,

fabricators of the gold and filver fillagree, which has been particularly Fillagree. described. Menangcabow has also been celebrated for its considerable traffick in gold, lying in the midst of the mines where it is chiefly pro- Gold. duced. Much cloth is wrought in, and exported from it. In this coun- Cloth. try they have, from the earliest times, manufactured arms for their own Firearms, use, and to supply the northern inhabitants of the island, who are the most warlike; and which trade they continue to this day; smelting, forging, and preparing the iron and steel for this purpose. How early they began to cast cannon, and make fire arms, I cannot take upon me to fay, but if they learned this art of the Europeans, which there is reason to doubt, they must have acquired it very suddenly, as the first Portuguese histories mention their using them. Their guns are those pieces called matchlocks, (fatinga); the improvement of springs and flints not being yet adopted by them *; the barrels are well tempered, and of the justest bore, as is evident from the excellence of the aim they take with them. From the great difficulty attending the process of preparing the metal, from iron ore, I would have been inclined to think it more probable, notwithstanding the affurances I have received to the contrary, that they procured their steel from the western nations; but besides that I know the small importation of that commodity from Europe at present, can by no means be adequate to their consumption; it is evident that their creefes and other weapons of the fword kind, are made of a species of that metal, entirely different from ours; and there cannot remain a doubt of its being their own manufacture. Powder they Gunpowder. make in great quantity, but either from the injudicious proportion of the ingredients in the composition, or the imperfect granulation, it is very defective in strength. Their arms, beside guns, are the coojoor, or lance, roodoos, calewang, buddil, pamandab, fewar and creefe. Thefe are. for the most part, weapons of a make between that of a scimitar, and a knife; fome; as the roodoos, which is a kind of short, broad sword, and the calewang; being flung at the fide, and others stuck in front through a belt that folds feveral times round the body. The fewar is a small instrument

^{*} Firelocks they call fnappan, from the Dutch, who perhaps were the first who used them in India.

Creefe.

of the stiletto kind, for affassination chiefly. The creese is a species of dagger, of a particular construction, worn by all descriptions of people. The blade is fourteen inches in length, of fleel tempered in fuch a manner, as to have an uncommon degree of hardness. It is not smooth or polished, like the blades of our weapons, but by a fingular process, made to appear like a composition, in which veins of a different metal seem to be visible. It is formed, not straight like a sword, nor uniformly curved, but waving in and out, as we fee depicted the flaming fwords that guarded the gates of paradife. This probably renders a wound given with it the more fatal. The head or haft is commonly of ivory, or fine grained wood, ornamented with gold, or a composition of that and Japan copper, called fooasso, polished, and curiously carved into a figure that b-ars fome resemblance to the Egyptian Isis; having, like that symbolic deity. the beak of a bird, with the arms of a human creature. The sheath is also made of some beautiful species of wood, hollowed out; with neat folds of split rattan, stained red, round the lower part. The value of a creefe encreases in proportion to the number of persons it has slain. One that has been the instrument of much bloodshed, is regarded with a degree of veneration as fomething facred. The horror or enthusiasm. that the contemplation of fuch actions inspires, is transferred to the inftrument; which accordingly acquires fanctity, from the principle that leads ignorant men to reverence whatever possesses the power of effecting mischief. The abominable custom of poisoning weapons, though much talked of, (legofo, it is termed) is rarely, I believe, if ever, put in practice by them in modern times, but it may have been prevalent formerly.

Other implements of warfare, Ranjows are sharp pointed stakes of bamboo, of different lengths, stuck into the ground, in order to penetrate the naked seet, or body, of an enemy. These are made use of in cases of slight, to anoy and retard the pursuers, and planted in the pathways, or among the long grass, by the vanquished party, as they run. They are also disposed in the approaches to fortissed doosoons. In time of war, they always form part of the military store of each combatant; and ressows, or lawless vagabonds,

bonds, never fail to carry a fupply about them at all feafons, to frustrate attempts of apprehending them for their crimes.

The people of Menangcabow are faid to go frequently to war, on Horses, horseback, but I shall not venture to give their force the name of cavalry, as I doubt much it's coming, in any degree, within that description. The chiefs probably may avail themselves of the service of this useful animal, from motives of indolence or state; or possibly, in marches, for the fake of expedition, they may employ horses for the troops; as they are in great plenty in that country. The natives, any more than the Europeans, never shoe them; nor is it necessary where there are no hard roads. The breed is fmall, but well made, spirited, and vigorous. Their wars, in general, are carried on rather in the way Mode of carof ambuscade, and surprize of straggling parties, than open combat. rying on war. When the latter does take place, they are careful to make it a long shot; and the firing is quite irregular. The foldiers have no pay, but the plunder is thrown into a common fund, and divided. Whatever might formerly have been the degree of their prowefs, they are not now much celebrated for it; yet the Dutch, at Padang, have often found them troublesome, from their numbers, and been obliged to secure themfelves within their walls, which the others have befieged. Between the Menangcabow people, those of Rou (called in the old writings Aru), and the Achenese, wars used to be perpetual; till within these twenty years, that our authority has been established at the settlement of Natal. and ferves as a check to them. It was impossible to walk a few miles. into the country, without meeting the remains of feveral breaftworks. (cootoor), * thrown up for defence, and some of them very substantial. Our factory there, was first raised upon one of these country fortifications. They carried on their campaigns very deliberately; making a practice of commencing a truce at funfet, when they were no longer under apprehension from each other. They sometimes agreed that hostilities should take place, only between fuch and fuch hours of the day. The English. refident, Mr. Carter, used frequently to be chosen their umpire, and upon these occasions, fixed in the ground his golden headed cane, on

A fortified village the Malays call coto, which is used in the same sense throughout Indoffan.

the spot where the deputies should meet, and propose terms of accommodation; till at length the parties, weary of their fruitless contests, agreed to place themselves respectively, under the dependance and protection of the Company. This must not be understood of the kingdoms of Menangcabow and Acheen, but of the settlers of these nations in the vicinity of Natal.

Religion.

The people of Menangcabow, are all Mahometans, and in that respect diftinguished from the other internal inhabitants of the island. This country is looked upon as the supreme feat of that religion; and next to a voyage to Mecca; which fome Sumatrans have undertaken; to have been at Menangcabow, stamps a man learned and of superior sanctity. The chief immums, moulanas, cattibs, and pandittas, either proceed from thence, or vifit it, and bring away a deploma, or certificate of degree, from the fultan or his ministers. How it has happened that the most ancient, and the most central kingdom in the island, should have become the most perfectly Mahometans, is a point difficult to account for; unless we suppose that the circumstance of its importance, and the richness of its gold trade, naturally drew thither its pious converters, from temporal as well as spiritual motives. In attempting to ascertain the period of this conversion of the Sumatrans, much accuracy cannot be expected: the natives are ignorant on the subject, and we can only approximate to the truth, by comparing the authorities of different old writers. John de Barros, a Portuguese historian of great information, fays, that according to the tradition of the inhabitants, the city of Malacca was founded about two hundred and fifty years before the arrival of his countrymen in that part of India, or about the year 1260, by a Javan of the name of Paramisora and his son Xachem Darxa, and that in the reigns of their fuccessors the people began by degrees to be converted to Mahomenatism, by Persian and Guzerat merchants who reforted thither; fo that about an hundred and fifty years before the date of his writing, or in the beginning of the fifteenth century, that faith had spread considerably, and extended itself to the neighbouring islands. Diogo do Couto, another celebrated historian, who profecuted his enqui-

Period of conversion to Mahomenatism.

ries in India, differs from the former in relating the circumstances of the foundation of Malacca, whose first prince he calls Raja Sabu, and says that in the reign of his fecond fon Cafemo, an Arabian priest arrived, and first preached the doctrine of the Caliphs, converting this king thereto. and giving him the name of Xa Mahamed, in the year 1384, Corneille le Brun was informed by the king of Bamtam, in 1706, that the people of Fava, were made converts to that feet, about three hundred years From these several sources of information, which are perbefore. feetly diffinet from each other, we may justly draw this conclusion, that Mahometanism, which sprang up in Arabia in the seventh century. had made no progress on Sumatra before the year 1400, and that the period of its introduction, confidering the vicinity to Malacca, could not be much later. Marco Paulo, the Venetian traveller, who, notwithflanding all the inaccuracies of his work, was doubtlefs in most of the countries which he describes, and certainly visited Sumatra or Java, or both; fays, that those of the people who lived near the sea shore, when he was on Java minor, about 1268, were addicted to the Mahometan law, which they had learned from the Saracen merchants. This throws the period of conversion back, upwards of an hundred years; but I am ferupulous of infifting on his authority.* Francis Xavier, the celebrated

^{*} To trace the course of Marco Paulo's travels, is wandering in a very obscure path, but not altogether destitute of glimmering light. The following abstract will enable the reader to form a judgment of his much disputed authenticity. " From Petan you go to the kingdom of Meletur, where are many spices, and a peculiar language. Steering to the southward of Petan, thirty three leagues, you arrive at the island of Java minor, (evidently Sumatra) in circuit about fix hundred and fifty leagues. It is divided into eight kingdoms, having a proper tongue. It firetches fo far to the fouthward. that the north pole is invisible. I, Marco Paulo, was there, and visited fix of the eight kingdoms; namely, Forlech, Bafman, Samara, Dragoiam, Lambri, and Fanfur. Those of the people of Forlech who inhabit the mountains, are without law, and live brutally, eating the flesh of all forts of beafts indifcriminately, and even human flesh: those who live near the borders of the fea, are Mahometans, converted by Saracen merchants. In Basman (quære Passamman) they have a peculiar language. Here we find elephants and unicorns (rhinoceros) with hides like buffaloes, feet like elephants, heads like wild boars, and a fingle horn on the fnout; many monkeys also, resembling the human figure, the skins of which are stuffed by the natives, deprived of the hair, and fold to strangers for a diminutive race of men. I was five months in Samara, waiting for the feafon. The inhabitants are favage, cruel, and addicted to eating human flesh. They

brated Jesuit Missionary, mentions, that when he was at Amboina, so late as 1546, the people were then beginning to learn to write from the Arabians: but that island lies very far to the eastward; and being of less considerable account in that age, than subsequent transactions have rendered it, the zeal and avarice of those religious adventurers, did not happen to be earlier attracted thither.

The inhabitants of Menangcabow did not only change their religion; or rather adopted one, where there was none before; but an entire alteration was likewife wrought in their language, laws, customs, and manners. This has indisputably been effected, by the settling among them of Malays from the peninsula, with whom the former correspond, at this day, in every point of resemblance; insomuch, that throughout the island, a Menangcabow man, and a Malay, are nearly synonimous terms; including in the limits of that kingdom, the sea coast of Atayangin,* whence they more immediately emigrate to the southern parts.

They have no wheat, but use rice for bread. They are apparently without vines, and extract their liquor from a certain tree, in which they make an incision; the juice as it distills, being received in a vessel. India nuts are likewise found here. In the kingdom of Dragoia (possibly that called An-drageri, and which in later times has been corrupted to Draguin), the people are favage idolaters, and fpeak a language of their own. When any of them are fick or infirm, and their magicians tell them they cannot recover, it is the practice for their friends to kill them by fuffocation. and then to eat their bodies, (which they justify by a curious argument). They also kill, and eat fuch strangers caught amongst them, as cannot pay a ransom. In Lambri (a name mentioned by Barros, and other Portuguese historians) grows much spice, and certain plants by them called Byrco, which, after transplanting, they let grow for three years, and then pluck them up by the roots. The inhabitants of the mountainous parts have tails a palm long. Unicorns, and other wild beafts abound here. In Fanfur (perhaps Campar) grows most rare and exquiste camphre, esteemed equal in value to gold. The inhabitants eat rice, and draw their liquor from trees. Here are feen trees with a foft bark, under which is found a white, mealy fubstance that is prepared into excellent food. I have eaten of it many times with much fatisfaction. (fago). Fifty leagues from Java minor, lie the islands of Necuran and Angania, and from the latter to the great island of Seylam, (Ceylon) is three hundred and forty leagues. Italian Edit. of 1601, and French of 1556.

Indeed

^{*} Atay-angin fignifies windward; but the part of Sumatra so called, extending from Natas to Priaman, does not, I should apprehend, take it's name from it's situation, but from the people, who probably settled there in considerable numbers from those eastern countries which lie to windward (with regard to the North east monsoon) of the peninsula of Malayo, and which are thence termed Atay-angin, as those on the western side of the peninsula, are termed Deboua-angin.

In fact the word "Malay," all over the east, no longer denotes an in- General achabitant of Malayo, strictly, nor one claiming his descent from thence; ceptation the word but a person whose language and religion are the same with theirs. Thus every black Christian is called, in India, a Portuguese, though his veins boast not a drop of European blood. The entire conformity of those people with the real Malayans, would induce us to think, on a superficial view, that they are, altogether, no other than a colony from the peninfula; or that an army from thence, conquered that part of the island, from Malayo. and extirpated the ancient inhabitants: to which opinion fome have added a conjecture; founded however on no history or tradition; that the first fultan was a descendant of the Calipbs, and settling in Sumatra. acquired extensive authority, as some others of that description, denominated Xeriffs, have down to the eastward. But to these hypotheses, there are strong objections. The idea entertained by the people, and Objections to firengthened by the glimmering lights that the old writers afford us, that opinion. bespeak an antiquity to this empire that stretches far beyond the probable æra of the establishment of Mahomenatism in the island. This antiquity is proved by the extensive and acknowledged jurisdiction of Menangcabow, at a period fo early, that when the Europeans first visited Sumatra, about the year 1500, it was then in the wane. The superstitious veneration for that ancient monarchy extends itself, not only where Mahomenatism has made a progress, but among the Battas, and other people not tinctured with that faith; which would not be likely to attend the government of a foreign intruder, who introduced a religion which they have refused to accept. So memorable an event would certainly have been long preserved by regular tradition, and some traces of it would have been discoverable, even at this time. The sultan, in the lift of his titles, would not fail, any more than the Xeriffs in the east, to boast of this facred extraction from the royal prophet, which he does not at all allude to: The most intelligent Indians whom I have confulted on this head; among whom was Raddeen, before mentioned, who as a prince himself, was conversant in these topics; positively asferted, that Menancabow is an original Sumatran empire, antecedent to the introduction of the Arabian faith; instructed, but in no shape conquered

" Malay."

Opinion that Menancabow is a colony

by people from *Malacca*. It does not feem probable, or confiftent with the general course of Malay colonization, that they should have subdued an inland country; being found, in every island whither they have had access, settled uniformly on the sea coasts only; to which they are naturally confined by their invariable attachment to trade and piracy.

Causes of the progress of Mahometa-nism among the Sumatrans.

Perhaps it is less surprizing that this one kingdom should have been compleatly converted to the Mahometan religion, than that fo many districts of the island, should remain, to this day, without any religion at all. It is observable, that a person of this latter description, coming to refide among the Malays, foon affimilates to them in manners, and conforms to their religious practices. The love of novelty; the vanity of learning; the fascination of ceremony; the contagion of example; veneration for what appears above his immediate comprehension, and the innate activity of man's intellectual faculties, which, fourred by curiofity, prompts him to the acquifition of knowledge, whether true or false: all conspire to make him embrace a system of belief, and scheme of instruction, in which there is nothing that militates against the prejudices he has already imbibed, but is rather congenial with them. He relinquishes no favorite ancient worship, to adopt anew; and is manifeftly a gainer by the exchange, when he barters, for a paradife and eternal pleasures, so small a consideration as the slesh of his foreskin.

Kingdom of Menancabow divided into different fovereignties. By late accounts it appears that the kingdom of Menangcabow, even in its limited state, is split into different sovereignties. Two Rajas, of Soorooaso, and Soongey Tarap, claim a share in the dominion, and in that quality sent each a deputation to the English chief at Padang, after the capture of that place in 1781, congratulating him on the success of our arms. Passamman; a populous country, and rich in gold, cassia, and camphire; which immediately borders on Menangcabow, to the northward, now disclaims all manner of dependance on it. This is governed by two rajas, of Sablooan, and Canallee, who boast an origin of high antiquity. One of them preserves, as his pesakko (relick), the bark of a tree, in which his ancestor was nursed in the woods, before the

Passamman people had reached their present polished state. The other, to be on a level with him, boafts poffession of the beard of a reverend predeceffor, which was fo bufhy that a large bird had made its nest in it. His fon, on the decease of the old man, cut it off, and it is said to be carefully preserved to this day.

The Malay governments, which are founded on principles more nearly Malay governfeudal, than others on the island, confift of a Raja * or prince, who mostly affumes the title of Sultan, introduced by the Arabians; under whom are a certain number of Dattoos, chosen from among the body of orang cayos, or men of rank; who have usually subordinate to them, a considerable train of immediate dependants or vaffals. From the dattoos, the fultan appoints the officers of state; as the shabandar, who regulates the customs of the port; the tamongoong, or commander in the wars; the bandabara, or administrator of justice, and others; differing in number and authority, according to the fituation, and importance of the kingdom. There is likewife a class of officers called oolooballang; which word is usually translated "champion," from their fighting fingly, when required, in the cause of the prince or noble who maintains them; but they may be described, more properly, as affassins, who like the originals of that name, (in the government of a prince of Asia minor, called the " old man of the mountain;" cotemporary with Richard the first of England) are dispatched by a weak, but arbitrary and blood thirsty monarch, to execute by furprize and stealth, his commissions of death: removing obnoxious persons, whom he dares not attack openly. In common they form the body guard of their masters, who do not every where employ them in those secret services.

ment in gene-

The title of dattoo is peculiar to the Malay governments, and wherever it is in use, the people may be distinguished as such. It has not however, proceeded from Malacca, but from Menangcabow. Bencoolen (Ben- Bencoolen. couloo); near which the English Presidency of Fort Marlborough is fituated, and where Fort York formerly flood; is a Malay town, go-

Title of datton.

verned

^{*} Raja was a title amongst the natives from the earliest times. It prevails also in Indostan, but whether adopted from thence by the Eastern people, is uncertain.

verned by four dattoos, under the protection, or dominion of the two pangerans,* of Soongey-lamo, and Soongey-etam, who each have possessions on different parts of the river which flows through the town: the principal fway being in the hands of him, of the two, who has most personal ability. They are constant rivals, though upon familiar terms with each other, and are only restrained from open war, by the authority These, properly, are not Malay, but native, country of the English. princes.

The fettlers on the rivers of Leemoon, Batang Affy, and Pacallang-jamboo; who are colonists from Menangcabow, established in those places, on account of the gold trade; are governed, each, by four dattoos likewife, who, though not immediately nominated by the fultan, are confirmed by, and pay tribute to him. The Leemoon dattoos, whose fituation is most foutherly, receive also the investiture, with title, badjoo (garment), and daytar (turban) from the ful an of Palembang; which is a political proceeding, and adopted by these merchants, for the convenience it may be productive of, in their trade with that place. I am uncertain whether the title of "Rattoo", which is of confiderable dignity, be Malay or not; but incline to think, nothwithstanding the near affinity in found to " datteo", that it is an original color or country word.

Indrapour.

Indrapour was once the feat of a monarchy of some confideration and extent. It's antiquity appears from an historical account given by the fultan of Bantam, to Corneille le Brun; in which it is mentioned, that the fon of the Arabian prince who first converted the Javans to Mahometanism, about the year 1400, having got himself declared sovereign of Bantam, under the title of pangeran, married the daughter of the raje of Indrapoura, and had, as her portion, the country of the Sillabares, a people of Banca-houlou. This was probably the first difmemberment, which the Javan monarchs long availed themselves of; and fince, the kingdom of Indrapour has dwindled into obscurity. From its Anac-foongey. ruins has sprung that of Anac-foongey; extending, on the sea coast, from

* A title introduced from Java, by the fultans of Bantam.

Mandoota river to that of Oori; the present capital of which, if such towns deserve the appellation, is Moco Moco.* The fultan of Bantam's dominion is faid to have extended from the fouthward, as far as Oori, and before that, to Retta or Ayer etam, between Ippoo and Moco Moco: but this last space was ceded by the fultan of Bantam, to the raja of Indrapour, in satisfaction for the murder of a prince. A small tax was laid on the Anac foongey people, on account of this murder, by the latter. and it is now paid to the fultan of Moco Moco. It is a foocoo (fourth part of a dollar), a bamboo of rice, and a fowl, from each village, every year. The government of Anac Soongey is Malay, but great part of the country dependant, on it is inhabited by the original doofcon people.+ The proattens (chiefs) are obliged to attend the fultan and carry their contribution or tax; but his authority is very much limited. The officers next in rank to the fultan are called Mantree, which fome apprehend to be a corruption of the word Mandarin, a title of diffinction amongst the Chinese. The name of the present monarch, is, Passifeer

Palemburg.

^{*} Sultan Guilemot was the first monarch of this new kingdom of Anac Soongey, and stablished himself at Mandoota, by the affistance of the English, in 1695. A revolution had happened in Indrapour, by which the old sultan, who had protected the English at their first settling, was driven out of his kingdom, by the intrigues of the Dutch. This induced the former to support Guilemot, who was at variance with the successor, as were also two other chiefs, named Roja Addil, and Raja Macoota. In 1698 the old sultan of Indrapour returned to his throne, but left Guilemot in quiet possession at Mandoota. Many years after, Guilemot was removed, and Gondam Shah, the father of the present sultan of Moco Moco, set up in his room. The space of time occupied by these three reigns is very extraordinary, especially if we consider that the first sultan must have been at man's estate in 1695; that the second succeeded him before his decease; and that the third is now alive. The fact is sufficiently corroborated by this circumstance, that the son of sultan Guilemot, called sultan Awal Laddeen, is still living, at Tappanooly, and supposed to be not less than ninety years of age. He was a state prisoner at Madras in the government of Mr. Morse.

[†] At the back of Indrapour and Anac Soongey, lie the Countries of Serampaye and Corinchia, where the Malay manners or religion, have not made the smallest progress. The people are inoffensive and laborious, but uncivilized, and feed coarsely. From the latter, abundance of horses are procured.

[†] The fame title prevails at Malacca, and from thence, it may by prefumed, it was introduced in Anac Soongey.

called Raja Moodo. The prefumptive heir is, in all Malay states,

deminion is faid to have extended from the fouthward, as far as Osic

Palembang-

Palembang, as has already been observed, is peopled mostly by Favans. in confequence of that part being formerly under the jurisdiction of the Bantam empire, whence its fovereigns were appointed. It is now under the immediate protection of the Dutch government at Batavia, who have a chief and factory there, and procure from it pepper and tin. It proves likewise an useful mart to them, for vending opium, and other commodities from the West of India. Its river; which takes its rife in the diffrict of Moolee, * near the West coast, and within a day or two's journey of that of Bencoolen, is the most advantageous for navigation of any in the island. High up, on its banks, the pepper is cultivated, and purchased of the natives at an extraordinary cheap rate, as I am informed. by an agent of the king or Dutch company, who resides there. The inhabitants of Passummah are mostly supplied with opium, falt and peice goods, from Palembang. The king's agent (for trade in these parts is ufually monopolized by the fovereign power) comes up the river with large boats, which are towed against the stream. In this manner the goods are conveyed to a place called Moarro Moolang; from whence they are transported, on men's backs, to that country. The voyage by the river, is faid to take up fourteen days; but the journey from Mogarro Moolang, where they disembark, to Passummab, is performed in one. Their returns are mostly in a species of twine called poolay; filk in its roughest state; and elephants teeth. 'The tin, (which the Malays call. timar, and some nations, calin) though exported from Palembang, is dug

^{*} Mr. Charles Miller, in his account of a journey made into this part of the country, mentions that after having croffed the range of hills which form the boundary of the Company's district, he came to a doofoon called Caloobar, fituated on the banks of the river Moose, (or Palembang) which is there pretty broad. Here he was shewn samples of sulphur, which is collected in great quantities, and carried to Palembang for sale. Tobacco, and poolay twine are likewise fent thither. Cassia is produced there, of which there are large woods. The country there about is level, the soil black and good, and the air temperate.

up in the island of Banca, which covers the mouth of the river, and constitutes a trade of considerable importance.*

The idea which has been given by a celebrated writer, of the immense riches accumulated by the king of Palembang, I had been used to look upon as wanting foundation in fact, both from the political improbability of the circumstance, considering his state of dependance, and from my not having ever heard the natives talk of his wealth, the fame of which might be supposed to reach our connexions in the inland country, did it really exist. Yet I have fince heard it observed by well informed persons, who were long conversant in the trade of that place, that the influx of filver there, without which tin cannot be purchased, is prodigious, and that there is no apparent channel through which it might be conjectured to flow back; the Dutch themselves being obliged to pay a large proportion of the value, in dollars, for all the cargoes they receive. This would prove that the country must be rich, if not the king, who appears to have no exclusive property in the produce of the mines; and yet the effect of these riches is not to be perceived. A difficulty in a point of a fimilar nature, presents itself on the West coast of the island, where thirty or forty thousand dollars are annually sent into the country, by the English, for pepper; little or none of which ever visibly returns, (the profits of the private trade of the residents being always remitted by bills) and yet both chiefs and people are univerfally poor. China is supposed, with reason, to be the gulph which, sooner or later, swallows up all the filver of India, and of America too; but in the inftances before us, it is hard to trace the subfidiary streams.

The late king of Palembang left the succession of his dominions, by lot, to a younger son; whom the eldest, after his father's death, obliged to

relinquish

^{*} The island of Junkcelon, on the Malayan coast, likewise produces abundance of tin. Recora port of great commerce in the island of Bintang, and which is now the medium of communication with China, is the mart to which this commodity is mostly carried. A number of European vessels, Malay praws, and China junks, annually resort thither, both on account of the goodness of the harbour, which is a salt water creek, and of it's being a free port.

Thither a number of armed praws were fent, with a requisition to the fultan to deliver up the fugitive. That monarch, on the contrary, declared his intention of supporting the younger brother's claim, and captured the vessels. The king of Palembang, apprehensive that this hostile proceeding would be followed by an attack on his country, was, about the year 1777, employed in collecting a large quantity of stones, in order to block up two of the mouths of the river; obliging each of the chiefs to contribute according to the number of their dependants; and fortified the third. This relation I have on the authority of an intelligent Malay.

Jambee.

Tambee was formerly a place of confiderable note, and both the English and Dutch Companies had establishments there. The town is situated about fixty miles from the fea, on a large river.* The trade confifts in gold dust, pepper and canes, but it is now esteemed of little importance, the gold being mostly drawn to the western coast, across the country. There are many other petty Malay states, at every large river on that fide of the ifland, but the extent of their respective powers are little known, their ports being feldom frequented except by the Cling (Telinga) or Moor vessels. Sometimes, but rarely, a private trading ship from Bengal, endeavors to dispose, at these places, of a few chests of opium, but the captains fcarcely ever venture on shore, and deal with fuch of the Malays as come off, at the fwords point; fo ftrong is the idea of their treacherous character. They are generally at war with the inland people, who confine them to the sea coast, and in some parts to the mere rivers. The principal of these are Indergeree, Siak and Battoo Bara. The river Racan, fituated between the two latter, and which is confiderably the largest in the island, is described to be so rapid, and attended with fo great a fwell, where it encounters the tide at the mouth, as to be The country of Aru or Rou, often mentioned unfit for navigation. by the Portuguese historians, borders on its banks. + Campar, another kingdom once famous, is fallen into obfcurity.

^{*} A Portuguese squadron, in 1629, was twenty two days employed in getting up this river, in order to destroy some Dutch ships that were sheltered near the town. Faria y Sousa, vol. 111.

[†] I suspect that the modern name of this river, Racan, or Arracan, as it is spelt in some charts, is an European corruption of the word Aru. Mendez Pinto says, that the town of Aru stood

All the country on this eastern fide of the island, from the straits of Sunda to Diamond point or Tanjong Gooree, is very low land, with scarcely any mountains visible, and mostly covered with woods. The northern coast, from thence to Acheen, presents a very different appearance, having a gradual flope to the foot of a range of high hills, and the lands well cultivated. Pasay, which was once the principal feat of government of this extreme of the island, is situated in a fine bay, called Telloo Samoway, where cattle grain, and all forts of provisions are in plenty. Timber, which in quality and fize, is faid to be adapted for masts to the largest ships, and of which abundance is cut on Sumatra, to be transported to Malacca and Batavia, grows close to the shore of this bay. The government and customs of these places are the same with those of all others where the Malay manners and language prevail, with very few and immaterial exceptions.

flood upon the river Panetican, and gives an inflance of the extreme rapidity of its current, as well as of it's great fize. Perhaps a jumble of the two words, may have produced that of Arracan. which I never heard a native make use of. Mention is made, at a subsequent period, of a river Forcan.

The country of Batta—Its productions—The inhabitants—Account of their manners, government, and some extraordinary customs.

Battas.

THE next confiderable distinction of people, as we advance to the northward, is the nation of the Battas, whose remarkable dissimilitude, in the genius of their customs and manners, to the other inhabitants of the island, renders it necessary that a particular degree of attention should be paid to their description. Although these people had frequently been mentioned by old writers, yet it was not until about the year 1752, when the English settled at Natal, and formed connexions in that part of the country, that they became properly known to any European, and their usages, extraordinary in some instances, were accurately ascertained.

Situation of the country.

The country of Batta may be faid, in a fummary way, to be bounded to the north, by that of Acheen, and to the fouth, by Passumman and the independent district of Rou or Aru: but more precisely, it is marked as extending from the great river of Sinkell, to that of Tabooyong, on the sea coast, and inland, as far south as Ayer Bongey, at the back of which the Reu people commence. The country is very populous, but the bulk of the people refide at a distance from the sea, in the central parts of the land, in extensive plains between two ridges of hills, on the borders of a great lake; where the foil is fertile, and cultivation fo much more prevalent, than in the fouthern districts, which are covered with woods, that there is scarce a tree to be seen but what the natives themselves have planted for use. The island being very narrow in this part, their towns lie, as well on the rivers that discharge themselves into the Straits of Malacca, as those which have their course towards the West coast; but their communication is now more open with this latter fide:

matter out of disputer . It is t

fide; owing to the supplies of falt and other articles, which they are regularly furnished with from the English settlements, and by traders from elecufelyes there, till an article of the treaty of P the continent of India.

The country is divided into a number of districts, of which the fol- Division. lowing are the principal; Ancola; Padambola; Mandeeling; Toba; Selendong; and Sinkell. The inhabitants of these are subdivided again into tribes; of which Ancola has five, Mandeeling three, and Toba five: the others I am not informed of. The other lettlement is on a fmall island, called

Our fettlements in this part of the island, are at Natal (Natar) English fettleand Tappanooly. At the former the communication with the Battas is indirect; none of them refiding on the spot. It is inhabited by persons Natal. fettled there, for the convenience of trade, from the neighbouring countries of Acheen, Rou and Menangcabow, and is by their concourse and traffick, populous and rich. A large quantity of gold is procured from the country, (some of the mines, or pits, lying within ten miles of the factory), and a confiderable vent is found for imported goods. Like other Malay towns, it is governed by Dattoos, one of whom is ftyled Dattoo buffar, or chief magistrate, and his sway is very great. Although the influence of the English company here is extensive, their authority is by no means fo firmly established, as in the pepper provinces, to the fouthward; owing to the numbers of people, their wealth, and enterprizing, independent spirit.* They find the English convenient for their protection

* Upon the reestablishment of the factory in 1762, the resident pointed out to the Dattoo buffar, with a degree of indignation, the number of dead bodies which were frequently feen floating down the river, and proposed his cooperating to prevent affassinations in the country; occasioned by the anarchy the place fell into, during the temporary interruption of the company's influence. "I cannot affent to any measures for that purpose, replied the dattoo: I reap from these murders an advantage of twenty dollars a head, when the families profecute." A compensation of thirty dollars per month was offered him, and to this he fcarcely fubmitted, observing that he should be a confiderable lofer, as there fell in this manner at least three men in the month. At another time, when the refident attempted to carry fome regulation into execution, he faid, " camee tradah fooco begeeto, orang cayo!" " we do not chuse to allow it, Sir;" and bared his right arm, as a fignal of attack to his dependants, in case the point had been infifted on. Of late years, habit, and a fense of mutual interest, have rendered them more accommodating.

from

from the usurpation, as they term it, of the Dutch; who formerly laid strong claim to the country, and persisted in their attempt to establish themselves there, till an article of the treaty of Paris, in 1763, put the matter out of dispute. It is therefore unnecessary to enter into any discussion of the respective claims of the two European nations; for which, however, I am in possession of the amplest materials. Neither in fact, have any right, but what proceeds from the will and consent of the native powers.

Tappanooly.

The other fettlement is on a small island, called Punchong cacheel, in the famous bay of Tappanooly, which is not surpassed, for natural advantages, in many parts of the world. Navigators fay that all the navies of Europe might ride there with perfect fecurity, in every weather; and fuch is the complication of harbours within each other. as to lead fome to affert, that a large ship could be so hid in them, as not to be found without a laborious and tedious fearch. Unfortunately it is but ill fituated with respect to the general track of shipping, and distance from the seat of our important India concerns; so that little use has hitherto been made of it. This bay stretches into the heart of the Batta dominions, and its borders are inhabited by that people; who barter here the produce of their country, for the articles which they stand in need of from abroad. The natives are in general inoffensive, and give little disturbance to our establishment. The Achenese long strove to drive us from Tappanooly, by force of arms, and we were under a necesfity of carrying on a war, for many years, with parties of that nation, in order to fecure our tranquility. They wanted to recover the trade with the country people, which our interference had obstructed and diminished.

Journey made into the Batta country. It is faid that no European ever penetrated twenty miles into the country which lies at the back of Natal. At Tappanooly, Mr. Holloway, chief of that place, and Mr. Miller, botanist, by orders from the council, performed a journey, in the year 1772, through the Batta districts in that quarter, with a view of enquiring into, and giving encouragement

couragement to the trade in Cassia, which had been some time discontinued.*

The

* The report of this journey is entered in the Company's records. An extract, containing the geographical part, is here given. "June 21st. 1772. We set out from Poolo Punchong, and went in boats to the qualloe of Penang Sooree river, which is fituated in the bay of Tappanooly, about ten or twelve miles to the fouth east of the former. The next morning we went up this river in fampans, and in about fix hours, arrived at a few Malay houses, at a place called qualine Loomoot. The whole of the country, on both fides of the river, is low, covered with woods, and uninhabited. About a quarter of a mile from hence, on the opposite side of the river, is a Batta campong (village) fituated on the fummit of a very beautiful and regular little hill, which rifes in apyramidical form, in the middle of a fmall meadow. June 23d. We walked through a level, woody country, to campong Loomoot; and next day to Sa-tarong. We next proceeded to Tappolin, to Siccia, and to Sa-pefang. The last is situated on the banks of Batang Tara river, three or four days journey from the fea; fo that our course had been hitherto nearly parallel with the direction of the coast. July 1st. We left Sa-pefang, and directed our course towards the hills, following nearly the course of Batang Tara river. We travelled all this day through a low, wood, and entirely uncultivated country. Our guide had proposed to reach to a Batta campong called Loomboo; but miffing the road, we were obliged to wade up the river between four and five miles, and in the afternoon arrived at a laddang (rice plantation) extremely fatigued: where the badness of the weather obliged us to stop and take up our quarters in an open paddeeshed. The next day the river was so much swelled by the heavy rains, that we could not proceed, and were forced to pass that day and night in the same uncomfortable situation. July 3d. We left the laddang, and walked through a very irregular, uninhabited country, full of rocks. and covered with woods. We this day croffed a ridge of very steep and high hills, and in the afternoon came to an inhabited and well cultivated country, on the edge of the plains of Ancola. We flept this night in a finall open shed, and the next day proceeded to a campong called Coto Lambong. July 5th. We went through a more open, and very pleasant country to Terimbaroo, a large Batta campong fituated on the fouthern edge of Ancola. The country hereabout is entirely cleared of wood, and either ploughed, and fown with paddee or jaggong (Indian corn), or used as pasture for their numerous flocks of buffaloes, kine and horses. July 7th. We left Terimbaroo, and proceeded on our journey to Sa-maffam. The country round is full of small hills, but clear of wood, and mostly pasture ground. July 10th. We proceeded towards Batang Onan. the campong where the Malays used to purchase cassia of the Battas. After about three hours walk over an open, hilly country, we again came into thick woods, in which we were obliged to pass the night. The next morning we crossed another ridge of very high hills, covered entirely with woods. In the evening we arrived at Batang Onan. This campong is fituated in a very extensive plain, on the banks of a large river which empties into the straits of Malacca, and is faid to be navigable for large floops, to within a day's journey of this place. July 11th. We went to Panka dooloot, the raja of which claims the property of the caffia trees; and his people used to cut and cure the cassia, and carry it to Batang Onan. The nearest cassia trees are about two hours walk from Panka-dooloot; on a very high ridge of mountains. July 14th. We left Batang Onan,

Productions.

The productions of the country are, camphire, gum benjamin, cassia, cotton and indigo. The domestic animals are horses, cows, bustaloes, goats, hogs and dogs of the cur kind; with the wild ones that are common to all parts of Sumatra. There is no gold found in the northern parts, nor any brought down to Tappanooley. Rice is extremely plenty in some of those districts which lie near the sea; and as scarce in others. At Natal this grain is said to yield a produce of seventy or eighty for one; and at a place called Soofoo, so much as an hundred. No benjamin is produced to the northward of Sinkell, nor to the southward of Batangtara, near the bay. The growth of the camphire tree is also much limited in point of extent; none being found south of the equinoctial.

Ancient building found. High up on the river called Battoo-bara; which, having its fource in the Batta country, empties itself into the straits of Malacca, and is always spoken of as the most navigable in that part of the island; is found a large brick building, concerning the erection of which no tradition is preserved among the people. It is described as a square, or several squares, and at one corner is an extremely high pillar, supposed by them to have been designed for carrying a slag. Images, or reliefs, of human sigures, are carved in the walls, which they conceive to be Chinese Fosses or idols. The bricks, of which some were brought to Tappanooly, are of a smaller size than those used by the English.

Persons of the Battas.

The Battas are in their persons rather below the stature of the Malay, and their complexions are fairer; which may perhaps be owing to their distance from the sea, an element they do not at all frequent.

in order to return, and stopped that night at a campong called Coto Moran, and the next evening reached Sa-massam; from whence we came by a different road from what we had travelled before, to Sa-pesang; where we got sampans and passed down the Batang Tara river, to the sea. July 22d. We returned to Poolo Punchong." It should be observed, that owing to some difficulties made by the country people, and the distaits actory conduct of the principal person who accompanied them as a guide, the object of Mr. Miller's journey was frustrated, and they did not even see the cassia trees. During the course of the journey they were every where treated with great hospitality and respect.

Their dress is commonly of a species of cotton cloth, which they Dress. manufacture themselves; strong, harsh, and of mixed colors, the most prevalent being a brownish red, and a blue nearly approaching to black. They are fond of adorning it with strings of beads. The covering of the head is usually the bark of a tree. The young women wear rings of tin in their ears, often to the number of fifty in each.

allowed to marry as many wives as they pleafe, or can

The food of the lower people is jaggong (maize), and fweet potatoes; Food. the rajas and great men only, indulging themselves in ordinary with rice. Some mix them together. It is on public occasions alone that they kill catttle for food; but not being very dainty in their appetites they do not fcruple to eat part of a dead buffaloe, aligator, or other animal, which they happen to meet with. Their rivers do not abound with fish; which is the case with most in the island, owing to their rapidity and frequent falls: yet no fea coast teems with greater abundance or variety. The horse they esteem their most luxurious food, and for this purpose feed them with great care, given them grain, and rubbing them well down. They abound in this country, and the Europeans get many good ones from thence; but not the finest, as these are reserved. for their feftivals. In a raying at edit modes or noting and more (entrod to

Some excellent species of timber, particularly the camphire, (the wood Houses in general of the country being light, porous and prone to decay) are in plenty here, and their houses are all built with frames of wood, and boarded; with roofs of ejoo, a vegetable substance that refembles coarse horsehair. They usually confist of one large room, which is entered by a trap door in the middle. Their towns are called " campong," in which the number of houses seldom exceeds twenty; but opposite to each, is a kind of open building, that ferves to fit in, during the day, and for the unmarried men to fleep in at night; and these together form a kind of Areet. There is also to each campong a balli, (as it is called by the Ma- Towns, called

^{*} Some of the fouth eaftern rivers are an exception. Sigk is noted for a trade in fifth roes. sured there, and called trobo.

lays), or town hall, for the transaction of public business, festivals, and the reception of strangers, whom they entertain with hospitality and frankness. At the end of this building is a place divided off, from whence the women see the public spectacles of fencing and dancing; and below that is a kind of orchestra for the music.

Domestic manners.

The men are allowed to marry as many wives as they please, or can afford, and to have half a dozen is not uncommon. Each of these fits in a different part of the large room, and fleeps exposed to the others; not being seperated by any partition, or distinction of apartments. Yet the husband finds it necessary to allot to each of them, their several fire places, and cooking utenfils, where they drefs their victuals feparately, and prepare his in turns. How is this domestic state, and the slimfiness of fuch an imaginary barrier, to be reconciled with our ideas of the furious, ungovernable paffions of love and jealoufy, supposed to prevail in an eastern baram? or must custom be allowed to supersede all other influence, both moral and physical? In other respects they differ little in their customs relating to marriage, from the rest of the island. The parents of the girl always receive a valuable confideration (in buffaloes or horses) from the person to whom she is given in marriage; which is returned when a divorce takes place against the man's inclination. The daughters, as elsewhere, are looked upon as the riches of the fathers. al of the country being light, pero

The condition of the women appears to be little better than that of flaves. They alone, befide the domestic duties, work in the rice plantations. These are prepared in the same mode as in the rest of the island; except that in the central parts, the country being clearer, the plough, drawn by busfaloes, is more used. The men, when not engaged in war; their favorite occupation; lead an idle, inactive life, passing the day in playing on a kind of a slute, crowned with garlands of slowers; among which the globe amaranthus, a native of the country, mostly prevails. Their music is somewhat preserable to that of the other Sumatrans.

They

They are much addicted to gaming, and the practice is under no kind of reftraint, until it destroys itself, by the ruin of one of the parties. When a man loses more money than he is able to pay, he is confined, and fold as a flave; which is almost the only mode by which they become fuch. A generous winner will formetimes let his unfortunate adversary off, upon condition of his killing a horse, and making a public entertainment. on ton Hiw it said suppose that it will not me, the the out will

Addicted to gaming.

A favorite diversion with these people is horse-racing. They use no Horse racing. faddle; the bit of the bridle is of iron, and has feveral joints; the headstall and reins, of rattan: in other parts the reins are of ejoo, and the bit, of wood. They are faid likewise to hunt the deer on horseback.

alone they regard as pollothing the faculties of free agents, who may

They have, as was observed in another place, a language and written character peculiar to themselves; and the Malay has there made less progress than in any part of the island. It is remarkable, that the proportion of the people who know how to read and write, is much greater than of those who do not; an advantage feldom observed in such uncivilized parts of the world, and not always found in the more polished.*

Language.

Their crimes against the order of society, are not numerous. Theft is almost unknown among them; being strictly honest in their dealings with each other. Pilfering, indeed, from frangers, when not restrained by the laws of hospitality; they are tolerably expert in, and think no

^{*} For specimens of their language, and writing character, see page 168.

⁺ Mr. Miller gives the following instances of their hospitality in the reception of strangers. "The raja of Terimbaroo, being informed of our intentions to come there, fent his fon and between thirty and forty men, armed with lances and matchlock guns, to meet us; who efcorted us to their campong, beating gongs, and firing their guns all the way. The raja received us in great form, and with civility ordered a buffaloe to be killed, and detained us a day. When we proceeded on our journey, he fent his fon and a number of armed people with us for our guard. Having made the accustomed prefents, we left Terimbaroo, and proceeded to Samassam; the raja of which place, attended by fixty or feventy men well armed, foon met us, and efcorted us to his campong, where he had prepared a house for our reception, and treated us with great hospiborrible cuffen prevailed more extensively, in ancitality and respect."

Punifaments.

Moral offence; because they do not perceive that any ill results from it. Adultery, in the men, is punished with death; but the women are only disgraced by having their heads shaved, and are sold for slaves; which in fact they were before. The distribution of justice in this case, is, I think, perfectly singular. It must proceed from their looking upon women as mere passive subjects. "Can you put butter near to a fire; say the Hindoo sages; and suppose that it will not melt?" The men alone they regard as possessing the faculties of free agents, who may controul their actions, or give way to their passions, as they are well or ill-inclined. Lives, however, are in all cases redeemable; if the convict, or his relations, have property sufficient; the quantum being in some measure at the discretion of the injured party.

Extraordinary cuftom prevalent amongft them.

But their most extraordinary, though perhaps not the most fingular custom, remains yet to be described. Many old writers had furnished the world with accounts of antbropophagi, or man-eaters, and their relations, true or falfe, were, in those days, when people were addicted to the marvellous, univerfally credited. In the fucceeding age, when a more feeptical and ferutinizing spirit prevailed, several of these afferted facts were found, upon subsequent examination, to be false; and men, from a biass inherent in our nature, ran into the opposite extreme. It then became established as a philosophical truth, capable almost of demonstration, that no fuch race of people ever did, or could exist. But the varieties, inconfiftencies, and contradictions of human manners, are fo numerous and glaring, that it is scarce possible to fix any general principle that will apply to all the incongruous races of mankind; or even to conceive an irregularity which fome or other of them have not given into. The voyages of our late famous circumnavigators, the authenticity of whose affertions is unimpeachable, have already proved to the world, that human flesh is eaten by the savages of New Zealand: and I can, with equal confidence, though not with equal weight of authority, affure the public, that it is also, at this day, eaten on the island of Sumatra, by the Batta people; and by them only. Whether or not the horrible custom prevailed more extensively, in ancient times, I cannot

Eat human flesh,

not take upon me to ascertain; but the same old historians, who mention it as practifed by the Battas, and whose accounts were undeservedly looked upon as fabulous, relate it also of many others of the eastern people; and of the island of Java in particular; who, fince that period, may have become more humanized.*

this custom.

They do not eat human flesh, as a means of satisfying the cravings Motives for of nature, owing to a deficiency of other food; nor is it fought after as a gluttonous delicacy, as it would feem among the New Zealanders. The Battas eat it as a species of ceremony; as a mode of shewing their detestation of crimes, by an ignominious punishment; and as a horrid indication of revenge and infult to their unfortunate enemies. The objects of this barbarous repalt, are the prisoners taken in war; and offenfenders convicted and condemned for capital crimes. Persons of the former description may be ransomed or exchanged, for which they often wait a confiderable time; and the latter fuffer only when their friends cannot redeem them by the customary fine of twenty beenchangs, or eighty dollars. These are tried by the people of the tribe where the fact was committed; but cannot be executed till their own particular raja, or chief, has been acquainted with the fentence; who, when he acknowledges the justice of the intended punishment, sends a cloth to

place, though not generally. It was hoppoled

^{*} Mention is made of the Battas and their customs, by the following writers. Nicoli di Conti 1449. Ramusio. " The Sumatrans are gentiles. The people of Batach eat human flich, and use the skulls of their enemies instead of money, and he is accounted the greatest man who has the most of these in his house." -- Odoardus Barbosa. 1519. Ramusio. " In Aru (which is contiguous to Batta) they eat human flesh."-Mendez Pinto, in 1539, was fent on an embaffy to the king of the Batas .- Beaulieu, 1622. " Inland people independent, and fpeak a language different from the Malayan. Idolaters and eat human flesh. Never ransom prisoners, but eat them with pepper and falt. Have no religion, but some polity."_____ De Barros, 1558. " The gentiles retreated from the Malays to the interior parts of the island. Those who live in that part opposite to Malacca, are called Battas. They eat human flesh, and are the most savage and warlike people of the island. Those which inhabit to the south are called Sotumas and are more civilized" -- Captain Hamilton. "The inhabitants of Delley (on a river which runs from the Batta country) are faid to be cannibals." Vartomanus, in 1504. writes that the Javans were man-eaters, before that traffick was had with them by Chinefe. which the people faid was no more than an hundred years. The same custom has been attributed to the Guess, inland of Cambodia, and also to the inhabitants of the Carnicobar illands.

Mode of pro-

put over the delinquent's head, together with a large dish of falt and lemons. The unhappy object, whether prifoner of war, or malefactor, is then tied to a stake; the people affembled throw their lances at him from a certain diffance, and when mortally wounded, they run up to him, as if in a transport of passion; cut pieces from the body with their knives. dip them in the dish of falt and lemon juice; slightly broil them over a fire prepared for the purpole; and swallow the morfels, with a degree of favage enthufiasm. Sometimes (I presume according to the degree of their animofity and resentment) the whole is devoured; and instances have been known, where with barbarity still aggravated, they tear the flesh from the carcase with their mouths. To such a depth of depravity may man be plunged, when neither religion nor philosophy enlighten his steps! All that can be said in extenuation of the horror of this diabolical ceremony, is, that no view appears to be entertained of torturing the fufferers; of encreasing or lengthening out the pangs of death: the whole fury is directed against the corse; warm indeed with the remains of life, but past the fensation of pain. I have found a difference of opinion in regard to their eating the bodies of their enemies flain in battle. Some persons long resident there, and acquainted with their proceedings, affert that it is not customary; but as one or two particular instances have been given by other people, it is just to conclude, that it fometimes takes place, though not generally. It was supposed to be with this intent that raja Neabin maintained a long conflict for the body of Mr. Nairne, a most respectable gentleman, and valuable fervant of the India Company, who fell in an attack upon the campong of that chief, in the year 1775.*

The

^{*} I find that fome persons still doubt the reality of the fact, that human sless is any where eaten by mankind, and think that the proofs hitherto adduced are insufficient to establish a point of so much moment in the history of the species. It is objected to me that I never was an eye witness of a Batta seast of this nature, and that my authority for it is considerably weakened, by coming through a second or perhaps a third hand. I am sensible of the weight of this reasoning, and am not anxious to force any man's belief, much less to deceive him by pretences to the highest degree of certainty, when my relation can only lay claim to the next degree. I can only say, that I thoroughly believe the sact myself, and that my conviction has arisen from the following circumstances, some of less, some of more authority. It is, in the first place, a matter of general

The government of the country is divided into a number of petty chief- Government. thips, the heads of which, ftyled rajas, are feldom dependant upon any fuperior power; but enter into affociations with each other, particularly those of the same tribe, for mutual defence and security, against any diffant enemy. They are extremely jealous of the increase of each others power, and on the flightest pretext a war breaks out between them. The force, however, of different campongs is very unequal, and fome rajas possess a much more extensive sway than others; and it must Power of the needs be fo, for every man who can get a dozen followers, and two or three muskets, sets up for independence, and scarcely acknowledges any fuperior. In the two districts of Ancola and Mandeeling, there appears some exception to this general defect of subordination, as they have each a fovereign raja over all the tribes; but their power is nominal merely, the great vaffals acknowledging little subjection, but when it suits their inclination, or interest.* Inland of a place called Sokum, great respect was paid to a female chief, or cotee, whose jurisdiction comprehended

and uncontroverted notoriety in the island: I have talked on the subject with natives of the country, who acknowledge the practice, and become ashamed of it when they have resided among more humanized people: It has been my chance to have had no less than three brothers, chiefs of the settlements of Natal and Tappanooly, where their intercourse with the Battas is daily. and who all affure me of the truth of it: The same account I have had from other gentlemen who had equal, or fuperior opportunities of knowing the customs of the people; and all their relations agree in every material point : A refident of Tappanooly (Mr. Bradley) fined a raja a few years fince, for having a prisoner eaten too close to the company's fettlement: Mr. Alexander Hall made a charge in his public accounts of a fum paid to a raja in the country, to induce him to spare a man whom Mr. Hall had seen preparing for a victim : Mr. Charles Miller, in the journal before quoted, fays " In the fappeou, or house where the raja receives strangers we faw a man's skull hanging up, which the raja told us was placed there as a trophy, it being the Rull of an enemy they had taken prisoner, whose body (according to the custom of the Baltas) they had eaten about two months before. Thus the experience of later days is found to agree with the uniform testimony of old writers; and though I am aware that each and every of these proofs, taken fingly, may admit of some cavil, yet in the aggregate I think they amount to satisfactory evidence, and such as may induce any person not very incredulous, to admit it as a fact. that human flesh is eaten by inhabitants of Sumatra, as we have positive authority it is by inhabitants of New Zealand.

^{*} The nephew is faid to fucceed to the place of Raja, in preference to the fon. I have heard that this unaccountable rule is observed in some other parts of the east.

many tribes. Her grandson, the reigning prince, had lately been murdered by an invader, and she had assembled an army of two or three thousand men, to take revenge. An agent of the Company went up the river, about sisteen miles, in hopes of being able to accommodate a matter which seemed to threaten materially the peace of the country; but he was told by the ootee, that unless he would land his men and guns, and take a decided part in her favor, he had no business there; and he was obliged to reimbark without effecting any thing. The aggressor followed him the same night, and made his escape. It does not appear likely, from the manners and dispositions of the people, that the whole of the country has ever been united under the jurisdiction of one monarch.*

Services due from inferiors to their chiefs. The more powerful rajas affume authority over the lives of their fubjects. The dependants, in all the campongs, are bound to attend their
chief in his journeys and in his wars, and when an individual refuses,
he is expelled from the society, without permission to take his property
along with him. The raja supplies them with food for their expeditions,
and allows a reward of two beenchangs of for each person they kill. When
he pays his gaming debts, he imposes what arbitrary value he thinks
proper, on the horses and buffaloes (no coin being used in the coun-

* The account given by Mendez Pinto of his embaffy to Angee firy Timor raja, king of the Battas, in the year 1539, may perhaps be thought to contradict this observation; but it is difficult to reconcile many of the circumftances he relates, or to form an idea of the place he went to. After leaving Malacca and doubling Acheen head, he failed for four days down the coast of the ocean, till he came to a river called Gaateangim (Atayangin), which had feven fathom water (quære Sinkell). He proceeded eight leagues up this river, when he anchored at Botterendan, near Panain, the refidence of the king. Returning, he coasted back for twenty fix leagues, when he entered the straits of Minhagaru and then stood over to Junkcelon. The king mentioned his having lost two places called Jocur and Lingau, by the Achenese, who put many of his Oolooballangs and Amborajas to death, (thefe are Malay, not Batta officers), and that he had fworn by his God Quiay Hocombinor, the dispenser of justice, to take revenge. (This name is likewife Malay fomewhat corrupted.) The king also paid adoration to a cow's head. He marched to Acheen, which is but twenty three leagues over land, and attacked the city with fifteen thousand men. He furnished a cargoe of Tin and Eenjamin for the vessel Pinto came in, and fent a present of gold headed lances, calambuca wood, and a tortoiseshell box ornamented with gold, to the governor of Malacca.

^{*} An imaginary valuation, about equal to four Spanish Dollars.

try) which he delivers, and his fubjects are obliged to accept them at the rate he tenders them. They are forced to work a certain number of days each, in his rice plantations. There is also a leffer kind of service, for land held of any other person. The tenant is bound to pay the landlord respect wherever he meets him, and to give him entertainment whenever he comes to his house. The people seem to have an absolute and permanent property in their poffessions; selling them when they think fitting to each other. If a man plants trees and leaves them, no future occupier can fell them, though he may eat the fruit.

The chief's revenues arise principally from the fines adjudged in ju- Revenues. dicial proceedings, which he always appropriates to himself; and from the produce of the benjamin and camphire trees throughout his district, which are confidered as royal property; but this, in general, is not rigoroufly infifted on.

Disputes and litigations of any kind, that happen between people be- Suits. longing to the same campong, are settled by a magistrate appointed for that purpose, and from him there is said to be no appeal to the raja: when they arise between persons of different campongs, they are adjusted at a meeting of the respective rajas. When a party is sent down to the bay, to purchase falt, or on other business, they are accompanied by an officer who takes cognizance of their behaviour, and fometimes punishes upon the fpot fuch as are criminal or refractory. This is productive of much order and decency.

Notwithstanding the independent spirit of the Battas, and their contempt of all power that would affect a fuperiority over their little focieties, they have in general a superstitious veneration for the sultan of of Menanca-Menangcabow, and shew a blind submission to his relations and emissaries. real or pretended, when fuch appear among them: even when infulted and put in fear of their lives, they make no attempt at refistance: they think that their affairs would never prosper; that their paddee would be blighted, and their buffaloes die; that they would remain under a kind of spell, for offending those sacred messengers.

Ware

The spirit of war is excited among these people by small provocation, and their resolutions for carrying it into effect are soon taken. Their life appears, in fact, to be a perpetual state of hostility, and they are always prepared for attack and defence. When they proceed to put their defigns into execution, the first act of defiance is firing, without ball, into the campong of their enemies. Three days are then allowed for the party fired upon, to propose terms of accommodation, and if this is not done, or the terms are fuch as cannot be agreed to, war is then fully declared. This ceremony of firing with powder only, is styled, " carrying smoke to the adversary." During the course of their wars, which fometimes last for two or three years, they seldom meet openly in the field, or attempt to decide their contest by a general engagement; as the mutual loss of a dozen men might go near to ruin both parties; nor do they often venture a direct attack upon each others campongs; but watch opportunities of picking off stragglers passing through the woods. A party of three or four will conceal themselves near the footways, and if they fee any of their foes, they fire, and run away immediately; planting ranjows (fharp stakes) after them, to prevent pursuit. On these occasions a man will subfift upon a potatoe a day, in which they have much the advantage of the Malays, (against whom they are often engaged in warfare) who require to be better fed.

Fortifications.

They fortify their campongs with large ramparts of earth, half way up which they plant brush wood. There is a ditch without the rampart, and on each side of that, a tall palisade of camphire timber. Beyond this, is an impenetrable hedge of the prickly bamboo, which, when of sufficient growth, acquires a surprizing density, and perfectly conceals all appearance of a town. Ranjows, of a length both for the body, and the feet, are disposed without all these, and render the approaches hazardous to assailants who are almost naked. At each corner of the fortress, instead of a tower or watch-house, they contrive to have a tall tree, which they ascend to reconnoitre or fire from. But they are not fond of remaining on the desensive in their campongs, and therefore, leaving a few to guard them, usually advance into the plains, and throw up temporary

porary breaftworks and entrenchments. They never engage hand to hand, always keeping at a pretty fafe diftance, feldom nearer than random fhot; except in case of sudden surprize.

Their standard in war, is a horse's head, from whence flows a long Arms, mane, or tail of hair. Their arms are matchlock guns, bamboo lances, and a fide weapon like a fword, or large knife. They carry no creefe like the Malays. Their ammunition boxes are provided with a number of little wooden cases, each containing a charge for the piece, which are just our ancient bandoleers; and in these are carried likewise their match. and fmaller ranjows, the larger being in a joint of bamboo, like a quiver, flung over the shoulder. They have machines curiously carved and adorned, for holding their bullets, and others, of uncommon conftruction, for a referve of gunpowder. This article they manufacture themfelves, procuring their faltpetre usually from goat's dung. The matchlocks they are supplied with by traders, who bring them from Menangcabow, where they are made: their fwords are of their own workmanfhip.

The natives of the fea coast exchange their benjamin and camphire, Trade. for iron, steel, brass wire, and salt; of which last, about an hundred thousand bamboos (gallons), are annually taken off in the bay of Tappanooly. These they barter again with the more inland inhabitants; in the mode I shall presently describe; for the products and manufactures of the country, particularly their cotton cloths; of which article very little is imported from abroad. Some wear a strip of foreign blue cloth about their heads, in imitation of the Malay daytar, and a few have badjoos (outer garments) of chintz; but upon the whole, the fale of piece goods in the bay is very inconfiderable.*

Having

^{*} A great trade is carried on from Natal to the island of Neas, which lies not far distant. The articles received from thence are Rice and Slaves, and of these last not less than four hundred and fifty annually, befide about an hundred and fifty which go to the northern ports: and in catching these unfortunate victims of the avarice of the chiefs, it is computed that not fewer than two hundred are killed; which together form a confiderable number for fuch a coun-

Estimate by commodities instead of coin.

Having no coin, all value is estimated among them by certain commodities. In trade they calculate by tampangs (cakes) of benjamin; in transactions amongst themselves, more commonly by buffaloes: sometimes brass wire, and sometimes beads are used as a medium. A galloon, or ring of brass wire, represents about the value of a dollar. But for small payments, salt is the most in use. A measure called a saloop, weighing about two pounds, is equal to a fanam or two pence halfpenny: a ballee, another smaller measure, goes for sour keppeng, or three sists of a penny.

Fairs held.

For the convenience of carrying on trade, there are established, across the country inland of Tappanooly, which is their great mart, four stages, at which they successively hold public fairs or markets, on every fourth day, regularly throughout the year; each fair lasting one day. The people in the district of the fourth stage assemble with their goods at the appointed place; to which those of the third resort and purchase of them: the people of the third, in like manner, supply the wants of the second; and the second of the first, who dispose, on the day their market is held, of the merchandize for which they have trasficked with the Europeans and Malays. On these occasions all hostilities are suspended. Each man, who possesses one, carries his musquet, with a green bough in the muzzle, as a token of peace, and afterwards, when he comes to the spot, following the example of the director or manager of the fair, discharges the loading into a mound of earth; in

try to fupply. The people of Neas are small in their persons; of a fair complexion, particularly the women, who are mostly sent to Batavia; but a great proportion of both sexes are infected with a species of leprosy, which covers their bodies with white scales; and their ears are made to extend in so preposterous a manner as to be often near touching their shoulders; which the purchasers of semales sometimes get trimmed to the natural size. They are remarkable for their ingenuity in handicrast works, and as an instance of their skill in the arts, they practice that of letting blood by cupping, in a mode nearly similar to ours. Among the Sumatrans blood is never drawn with so salutary an intent. The language and manners of this people have a resemblance to those of the Battas; but yet differ in many material respects. Their principal sood is pork, and the chiefs make a practice of ornamenting their houses with the jaws of the hogs, as well as the skulls of the enemies which they kill. They are revengeful in their tempers, and esteemed dangerous as domestic slaves; a defect in their character which philosophers will not hesitate to excuse in an independant people, torn by violence from their country and connexions.

which,

which, before his departure, he fearches for his ball. There is but one house at the place where the markets are held, and that is for gaming: regular rows of fruit trees, mostly doorean, are planted, which ferve for booths; one avenue of which is referved for the women. People from the extremes of the north and fouth meet at these fairs, where all their trade is carried on.*

Their religion, like that of all the other original inhabitants of the island, Religion. is fo difficult to be traced, as fcarce to afford room to fay that any exists among them. Yet they have rather more of ceremony, than the people of Rejang or Passummab; and there is here an order of persons who may be denominated priefts, as they perform the office of burying the dead, and of foretelling lucky and unlucky days, which they are extremely fuperstitious in the observance of: one of these is employed in each campong. They have some idea of a powerful Being, disposed to benevolence, and of another, the worker of ill to mankind; but they pay no worship to either; nor do they appear to entertain any hopes or apprehension of a future state. It is faid that they have a name for the former, which they fear to pronounce, but I have some reason to think it the word " Daibattab," which I learned from a different authority; that name corresponding, as before observed, with the general name for the Deity throughout the east. The evil spirit they call Murgifo. Their only ceremonies that wear the appearance of religion, are those used on taking an oath; in their prognostications; and at their funeral rites. A person accused of a crime, and who afferts his innocence, is in fome cases acquitted by solemnly swearing to it, but is sometimes obliged to go through a kind of ordeal. They have different modes of administering an oath. A cock's throat is usually cut upon the occasion: the accused then puts a little rice into his mouth, and wishes that it may become a stone, if he is guilty of the crime with which he stands charged; or holding up a musquet bullet, wishes it may be his fate to be shot, in that case. In more important instances, they put a small leaden or tin

^{*} These fairs, called onan by the Malays, are not confined to the Batta country: there are fuch at Batang-capas, and at Ippoo, but not attended with the same formalities.

image into the middle of a dish of rice, garnished with musquet balls; and the man, kneeling down, prays that his crop of paddee may fail, his cattle die, and that himself may never take falt, (which I presume is regarded as necessary to existence) if he does not declare the truth. These tin images may possibly be looked upon as objects of idolatrous worship; but I could never learn that any species of adoration was paid to them on other occasions. Like the relicks of saints, they are merely employed to render the form of the oath more mysterious, and thereby increase its awfulness. I have seen carved resemblances of a horse's head, which though vulgarly called Batta gods, are nothing more than the standards in war, before mentioned.

Divinations.

Before they go to war, they kill a buffaloe, or a fowl that is perfectly white, and by observing the motion of the intestines, they judge of the good or ill fortune that will attend them. The priest who performs this ceremony, had need to be infallible, for if he predicts contrary to the event, he is sometimes put to death, for his want of skill.

Funeral rites and ceremonies When a raja, or person of consequence, dies, the funeral usually takes up several months; that is, the corpse is kept, for so long a space of time, unburied; until the neighbouring and distant rajas; and in common cases, till the relations and creditors of the deceased; can be assembled, in order to celebrate the rites with becoming dignity. Perhaps the season of planting, or of harvest intervenes, and these necessary occupations must be first attended to, before the ceremonies can be concluded. The corpse, in the mean time, is deposited in a fort of cossin, made of the hollowed trunk of the anou tree, well covered over with dammar or rosin. A bamboo tube, however, is inserted in the lower part of the cossin, and passing thence into the ground, serves to carry away the offensive matter; so that in fact the bones alone remain.

When the people affemble, the coffin is brought out, and fet down in an open space. Each of the women who arrive, brings a basket of rice, and places it near the corpse: they dance round it, and make merry,

till

till the provision is expended; one or more buffaloes, or horses, being killed and feafted on at the fame time. The priest then, (whose limbs are tattowed in the shape of birds and beasts, and painted of different colors)* takes a piece of buffaloe's flesh; swings it about, throwing himself into violent attitudes, and strange contorsions; and then eats the morfel in a voracious manner. He afterwards kills a fowl over the dead body, letting the blood run upon the coffin; he then takes a broom, of the coco-nut fibres, and fweeps furiously about him, as if to chace away fome evil spirit; when suddenly, four men, appointed for the purpose, lift up the coffin, and run quickly off with it, as if escaping from the fiend; the priest continuing to sweep after it for some distance. It is then put into the ground, at the depth of three or four feet; the earth about the grave is raised; a shed built over it; and the horns of the buffaloes killed upon the occasion are nailed to the posts. + The people then depart in peace to their respective homes.

This nation has preferved the original genuineness of its character and manners, more unmixed than any other inhabitants, at least of the nor- preserved in thern parts of the island. This may be owing to several causes; as their distance in general from the sea coast, and total unacquaintance with na- Causes of this vigation; and to the want of gold in their country (except at the fouthern extremity) to excite the rapacity of invaders, or avarice of colonifts: the vegetable riches of the foil being no object for fuch, as they are more advantageously obtained in trade, from the unmolested labors of the natives themselves. To this we may add, the divided nature of the government, and confined independence of the petty chiefs, which is un-

this nation.

^{*} In the Nasfau islands (called by the Malays the Poggees) the inhabitants (orang Mantawaye) are univerfally tattowed in this manner, and their skin discolored. This custom appears to have been once very general in this part of the east, but an intercourse with other nations causes it to wear away. Befide the pintados of the Philippines, it prevails among the people of Laos, and has been observed of the Siamese. See an Historical Relation of Expeditions to those islands by Alexander Dalrymple, Efq.

⁺ Mr. Miller fays he was present at killing the hundred and fixth buffaloe, at the grave of a raja, which ceremony they continue for a year after the interment.

favorable to the propagation of new opinions and customs, (as the adoption of them by no one raja would ferve as authority to others, but the contrary) and which is not the case where people are united under one head, whom they look up to as the standard of their conduct. This was probably the reason of the complete conversion of the subjects of Menangcabow to Mahometanism. And lastly, it may be presumed that the idea maintained of the ferociousness of the people, from their practice of eating their prisoners, might probably damp the ardor, and restrain the zealous attempts of religious innovators. but node spirit live emol

lift up the coffin, and run quickly off with it, as if eleaping from the fiend; the prieft continuing to fweep after it for fome diffunce. Kingdom of Acheen-Present State of it's Commerce-Air and foil-Inhabitants-Government-Revenues-Modes of punishvery the great mart of eathern commodisies, at this

ACHEEN (properly Aché)* is the only kingdom of Sumatra, that ever arrived to fuch a degree of political confequence in the world, as to occasion it's transactions becoming the subject of general history. But it's present condition is widely different from what it was, when by it's power the Portuguese were expelled from the island, and it's princes received embassies from all the great potentates of Europe.

It's fituation occupies the North West extreme of the island. The ex- Situations tent, strictly speaking, reaches no farther, inland, than about forty or fifty miles, to the fouth eaft, and now but little farther even on the fea coaft; though formerly it's king boafted a dominion as far down as Indrapour, and possessed complete jurisdiction at Ticon. A place called Carty, not far distant from Battoo Bara river, forms the boundary on the east coast; the principal intermediate towns being Pedeer, Samerlonga, and Palay. On the West coast it extends to Baroos; between which and Acheen, lie Tappoos, Sinkell, Tampat Tooan, Labooan Hadjee, Socfoo, Nalaboo, Arigas, and Dyah. There is likewill and a residence of it's trade. There is likewill a subject to the control of the co

The interior inhabitants, from Acheen to Sinkell, are diffinguished into those of Allas, Reeab, and Carrow. The Achenese manners prevail among the two former, but the Carrow people refemble the Battas. whose country they are divided from by a chain of mountains.

On a river which empties itself near the North West point, or Acheen Capital: head, flands the capital, about two miles from the qualloe or mouth, in a wide valley, formed like an amphitheatre, by two lofty ranges of

hills

^{*} It is faid, by the Malays, to have been fo named from a species of tree called Aché, peculiar This is the pachaubant or softus buttens, and called whom by the Malay spalq tatt of

hills. The river is not large, and by emptying itself in feveral chan nels, is rendered very shallow at the bar. In the dry monsoon it will not admit boats of any burthen, much less large vessels, which lie with-

out, in the road formed by the islands off the point. Though no lon-

Present state of its commerce.

ger the great mart of eastern commodities, it still carries on a considerable trade with the natives of that part of the coast of Indostan called Telinga, who supply it with the cotton goods of their country, and receive in return, gold dust, sapan wood, betel-nut, patch-leaf,* a little pepper, fulphur, camphire, and benjamin. The two last are carried thither from the ports of Sinkell and Tappoos; and the pepper from places more to the fouthward, Acheen itself not producing any in these days, nor in much abundance at any former period, though cargoes were often taken in from thence. There are employed in this commerce, from fix to ten Telinga snows, of an hundred and fifty or two hundred tons burthen, which arrive annually about August, and fail again in February and March. They are not permitted to touch at any places on the East or West coast, that are under the king of Acheen's jurisdiction, as he would fuffer both in the profits of the trade, the port customs, and the prefents usually made on the arrival of vessels, which, in that case, his dependants would share with him. The people of Acheen themselves carry the cloth to these markets, after the king's duties, and other advantages have been received, who is, as is usual with the princes in this part of the world, the chief merchant of his capital, and frequently the monopolizer of it's trade. There is likewise a ship from Surat every year, and fometimes two, the property of Moor-men there. The country is supplied with Bengal opium, and also with iron, and many other articles of merchandize, by the European traders.

Air

Acheen is esteemed, comparatively, healthy, being more free from woods and swamps than most other portions of the island; and the fevers and dyfenteries to which these are supposed to give occasion, are there faid to be uncommon. But this must not be too readily credited; for he degree of falubrity attending fituations in that climate, from inferutable canses, is known so frequently to alter, that a person who has re-

^{*} This is the pachaubaut or coffus Indicus, and called delum by the Malays.

fided only two or three years on a spot, cannot pretend to form a judgment; and the natives, from a natural partiality, are always ready to extol the healthiness, as well as other imputed advantages of their own particular countries. is a very rude and uncough piece of architechure.

The foil is light and fertile, and the products; befide those which I soil. have enumerated as articles of export trade, and a variety of fine fruits; are chiefly rice and cotton. There is likewise a little raw filk procured in the country, of very inferior quality. Gold dust is collected in the mountains near Acheen, but the greatest part is brought from the southern ports of Nalaboo and Soofoo.* The fulphur is gathered from a volcano mountain in the neighbourhood, which fupplies their own confumption. for the manufacture of gunpowder, and admits of a large exportation.

Inhabitants.

The Achenese differ extremely, in their persons, from the rest of the Sumatrans, being, in general, taller, stouter, and much darker complexioned. They are by no means, in their present state, a genuine people, but thought, with great appearance of reason, to be a mixture of Battas, Malays, and Moors from the west of India. In their dispofitions they are more active and industrious than their neighbours; they poffess more penetration and sagacity; have more general knowledge; and as merchants, they deal upon a more extensive and liberal footing. But in this latter respect, I speak rather of the traders at a distance from the capital and their transactions, than of the conduct observed at Acheen, which, according to the temper of the reigning monarch, is often narrow, extortionary, and oppressive. Their religion is Mahometanism, and having a great number of Mosques and priests, it's forms and ceremonies are observed with some strictness.

The appearance of the town, and the nature of the buildings, i are Buildings. much the same as are found in the generality of Malay bazars; except-

In the estimate p. 137, of the quantity of gold exported from the island, I did not include Acheen, and I underrated the produce of Padang by at least one third, not making allowance for

ports of Nalabco and Soc.co. The fulpher is cathered from a volcine

make no apology for introducing it. "Imaginez yous une forêt de cocotiers, de bambous, d'ananas, de bagnaniers, au milieu de laquelle paffe une affez belle riviere toute couverte de bateaux; mettez dans cette forêt une nombre incrovable de maifons faites avec de cannes, de rofeaux, des ecorces, et disposez les de telle maniere qu'elles forment tantôt des rues, et tantôt des quartiers feparés : coupez ces divers quartiers de prairies & de bois : repandez par tout dans cette grand forêt, autant d'hommes qu'on en voit dans nos villes, lorsqu'elles font bien peuplées; vous vous formerez une idée affez juste d'Achen; et vous conviendrez qu'une ville de ce goût nouveau peut faire plaifir à des etrangers qui paffent. Elle me parûut da'bord comme ces payfages fortis de l'imagination d'un peintre ou d'un poëte, qui rassamble sous un coup d'œil, tout ce que la compagne a de plus riant. Tout est negligé et naturel, champêtre and même un peu sauvage. Quand on est dans la rade, on n'apperçoit aucun vestige, ni aucune apparence de ville, parceque des grands arbres qui bordent le rivage en cachent toutes les maifons; mais outre le payfage qui est tres beau, rien n'est plus agréable que de voir de matin un infinité de petits bateaux de pêcheurs qui fortent de la riviere avec le jour, et qui ne rentrent que le foir, lorsque le soleil se couche. Vous diriez un essain d'abeilles qui reviennent a la cruche chargé du fruit de leur travail." Lettres Edifiantes, Tom. 1.

* Near the gate of the palace are several pieces of brass ordnance of an extraordinary size; of which fome are Portuguese; but two in particular, of English make, attract curiosity. They were fent by king James the first to the reigning monarch of Acheen, and have still the founder's name, and the date, legible upon them. The diameter of the bore of one, is eighteen inches; of the other twenty two or twenty four. Their strength however does not appear to be in proportion to the caliber, nor do they feem in other respects to be of adequate dimensions. James, who abhorred bloodfhed himfelf, was refolved that his prefent should not be the instrument of it to others.

is effablished, and supplies an extensive demand. They weave also very handsome filk pieces, of a particular form, for that part of the dress which is called by the Malays, cayen farrong; but their filk manufacture has much decreased within these twelve years, owing, as they say, to an unavoidable failure in the breed of filkworms; or more probably to the decay of industry amongst themselves.

They are expert and bold navigators, and employ a variety of veffels, Navigation, according to the voyages they have occasion to undertake, and the purposes, either of commerce or war, for which they defign them. the river is covered with a multitude of fishing sampans or canoes, which go to fea with the morning breeze, and return in the afternoon, with the fea wind, full laden.

Having no convenient coins; though most species of money will be taken there at a valuation; they commonly make their payments in gold dust, and for that purpose are all provided with scales or small steelyards (datchin). They carry their gold about them, wrapped up in pieces of bladder and often purchase to so small an amount, as to make use of grains of paddee, or other feeds, for weights. Their principal standard weight is the buncall, of one ounce, ten penny weights, and twenty one grains. The tale, an imaginary valuation, is one fifth of a buncal of gold; and is equal to fixteen mace, which are very small gold pieces, of the value of fifteen pence each.

The monarchy is hereditary, and is more or less absolute, in proportion to the talents of the reigning prince; no other bounds being fet to his authority, than the counterbalance or check it meets with. from the power of the great vassals, and disaffection of the commonality. But this refistance is exerted in fo irregular a manner, and with fo little view to the public good, that nothing like liberty refults from it. They experience only an alternative of tyranny and anarchy, or the former under different shapes. Many of the other Sumatran people are in the possession of a very high degree of freedom, founded upon a rigid at-

Government.

tachment

maintains a guard of an hundred Sepoys (from the Coromandel coast) about his palace, but pays them indifferently.

The grand council of the nation confifts of, the King or Sultan, four Oolooballangs, and eight of a lower degree, who fit on his right hand; and fixteen cajoorangs, who fit on his left. At the king's feet fits a woman, to whom he makes known his pleasure; by her it is communicated to an Eunuch, who fits next to her, and by him to an officer named Cajooran Gondong, who then proclaims it aloud to the affembly. There are also present two other officers, one of whom has the government of the Bazar or market, and the other, the superintending and carrying into execution the punishment of criminals. All matters relative to commerce and the customs of the port come under the jurisdiction of the Shabandar, who performs the ceremony of giving the chap or license for trade; which is done by lifting a golden hafted creese over the head of the merchant who arrives, and without which he dares not to land his goods. Prefents, the value of which are become pretty regularly afcertained, are then fent to the king and his officers. If the stranger be in the style of an embassador, the royal elephants are sent. down to carry him and his letters to the monarch's presence, these being first delivered into the hands of an eunuch who places them in a filver dish, covered with rich filk, on the back of the largst elephant, which is provided with a machine (bouder) for that purpose. Within about an hundred yards of an open hall where the king fits, the cavalcade stops, and the embaffador difmounts and makes his obeifance by bending his body, and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his shoes and having made a second obeisance, is seated upon a carpet on the sloor, where betel is brought to him. The throne was fome years ago of ivory and tortoiseshel, and when the place was governed by Queens, a curtain of gauze was hung before it, which did not obstruct the audience, but prevented any perfect view. The stranger, after some general discourse, is then conducted to a seperate building where he is entertained with the delicacies of the country, by the officers of state, and in the evening returns

returns in the manner he came, furrounded by a prodigious number of lights. On high days (aree ryah) the king goes in great state mounted on an elephant richly caparifoned, to the great mosque, preceded by his colooballangs; who are armed nearly in the European manner.

The country under the immediate jurisdiction of Acheen, is divided into three diffricts, named Duo pooloo duo, Duo pooloo leemo, and Duo pooloo anam. Each district is governed by a Pangleemo, and under him, an Immum and four Pangeechees to each mosque. The country is wonderfully populous, but the computations with which I have been furnished, exceed fo far all probability, that I do not venture to infert them. The number of mosques in the three districts is said to be, in the first, five hundred, in the fecond two hundred, and in the third four hundred; which also appears incredible, confidering the small extent of territory that the whole includes. Could we suppose the account just, we must allow them to be the most devoted to religion of any people on the face of the earth.

The only regular tax or imposition the country is subject to, Revenues, for the use of the crown, is a Measure of Rice, annually, from each proprietor of land, which they carry in person to the court; and this can be looked upon only as a token of homage, for they never fail to receive from the king, an equivalent in return, of tobacco or fome other article. His revenues arise folely from the import and export customs, which I am informed, amount to forty catties weight (each being estimated at one pound and a third*) of gold, or about two thousand five hundred pounds sterling, yearly. The Telinga merchants pay very high duties; in the whole not less than fifteen per cent. The revenues of the nobles, arise from taxes on the different countries under their respective jurisdictions. At Pedeer, a measure of rice is paid to the feudal lord for every measure of paddee sown, which is about the twentieth part

^{*} The weight of the catty differs extremely-In some places, and I beleive at Malacca, it is reckoned at 30 oz. 17dwt. 12gr. troy.

of the produce of the land. At Nalaboo there is a capitation tax of a dollar a year. At various places on the inland roads, there are tolls collected upon provisions and goods which pass.

The kings of Acheen possess a Grant of territory along the sea coast, as far down as Bencoolen, from the sultan of Menangcahow, whose superiority has always been admitted by them, and will be, perhaps, so long as he claims no authority over them, and exacts neither tribute nor homage.

Administration of justice.

Punishments.

Acheen has ever been remarkable for the feverity with which crimes are punished by their laws: the same rigour still subsists, and there is no commutation admitted, as is regularly established in the fouthern countries. There is great reason however to conclude, that the poor alone experience the rod of justice; the nobles being secure from retribution in the number of their dependants. Petty theft is punished by fuspending the criminal from a tree, with a gun or heavy weight tied to his feet; or by cutting off a finger, a hand, or leg, according to the nature of the theft. Many of these mutilated, and wretched objects are daily to be feen in the streets. Robbery on the highway and housebreaking are punished by drowning, and afterwards exposing the body on a stake for a few days. If the robbery is committed upon an Immum or prieft, the facrilege is expiated by burning the criminal alive. A man who is convicted of adultery, is feldom attempted to be fereened by his friends, but is delivered up to the friends and relations of the injured hufband. These take him to some large plain, and forming themselves in a circle, place him in the middle. A large weapon called a Gadoobong, is then delivered to him by one of his family, and if he can force his way through those who surround him, and make his escape, he is not liable to further prosecution; but it commonly happens that he is inftantly cut to pieces. In this case his relations bury him as they would a dead buffaloe, refusing to admit the corpse into their house, or to perform any funeral rites. Would it not be reasonable

able to conclude, that the Achenese, with so much discouragement to vice, both from law and prejudice, must prove a moral and virtuous people? yet all travellers agree in representing them as one of the most dishonest and flagitious nations of the east; which the history of their government will tend to corroborate.

tory of their government will tend to corroborat THE Portuguese, under the conduct of Vasco de Gama, doubled the Cape of Good Hope in the year 1497, and arrived on the coast of Malabar in the following year. These people, whom the spirit of glory, commerce, and plunder, led to the most magnanimous undertakings, were not so entirely engaged by their conquests on the continent of Indostan, but that they turned their idea to the discovery of regions yet more distant. They learned from the merchants of Guzerat some account of the riches and importance of Malacca, a great trading city in the farther peninfula of India, supposed by them the golden Chersonesus of Ptolomey. Intelligence of this was transmitted to their enterprizing fovereign, Emanuel, who became impressed with a strong defire to avail himself of the flattering advantages which this celebrated country held out to his ambition. He equipped a fleet of four ships under the command of Diogo Lopez Sequeira, which failed from Lisbon on the eighth day of April 1508, with orders to explore, and establish connexions in those eastern parts of Asia. After touching at Madagascar, Sequeira proceeded to Cochin, where a ship was added to his fleet, and departing from thence on the eighth of September 1509, he made fail towards Malacca; but having doubled the extreme promontory of Sumatra (then called Tabrobane) he anchored at Pedeer, i a principal port in that island,

A regularly connected detail it is impossible to furnish from the imperfect and obscure accounts which have been handed down to us of the transactions of this part of the world; but yet it will not be esteemed a labor quite useless and unsatisfactory, thus to collect and arrange in the order of their dates, the many events, more or less detached, which historians and navigators have recorded in their writings.

1508.

x500.

⁺ Pedeer and Pafay were anciently the places of most importance in this part of Sumatra. The power of the former, which had been predominant, was beginning to decline about the period of the Portuguese discovery, and that of Pasay to gain the ascendency. De Barros. Mention is made of Pedeer by Ludovicus Vartomannus, who wrote some years previous to this time, and had himself visited it. The writers whose accounts I chiefly follow in this early part of the history, are De Barros and Osorius.

in which he found veffels from Pegu, Bengal, and other countries. The king of the place, who, like other Mahometan princes, was flyled Sultan, fent off a deputation to him, accompanyed with refreshments, by which he excused himself, on account of illness, from paying his compliments in person; affuring him at the same time that he should derive much pleasure from the friendship and alliance of the Portuguese, whose fame had reached his ears. Sequeira answered this message in such terms, that by consent of the fultan, a monument of their amity was erected on the shore; or more properly as the token of discovery and possession usually employed by the European nations. He was received in the fame manner at a place called Pasay, lying about twenty leagues farther to the eastward on the same coast, and there also erected a monument or cross. Having procured at each of these ports as much pepper as could be collected in a fhort time, he hastened to Malacca, where the news of his appearance in those seas had anticipated his arrival. Here he was near falling a facrifice to the infidious policy of Mahumad the reigning king, to whom the Portuguese had been represented by the Arabian and Persian merchants, (and not very unjustly) as lawless pirates, who under the pretext of establishing commercial treaties, had, at first by encroachments, and afterwards with rapacious insolence, ruined and inflaved the princes who were weak enough to put a confidence in them, or to allow them a footing in their dominions. He escaped the fnares that were laid for him, but loft many of his people, and leaving others in captivity, he returned to Europe, and gave an account of his proceedings to the king.

A fleet was fent out, in the year 1510, under Diogo Mendez, to eftablish the Portuguese interests at Malacca; but Affonso d'Alboqueque, the governor of their affairs in India, thought proper to detain this foundron on the coast of Malabar, until he could proceed thither himfelf with a greater force; and accordingly on the second of May, 1511, he fet fail from Cochin with nineteen ships and fourteen hundred men. He touched at Pedeer, where he found fome of his countrymen who had made their escape from Malacca in a boat, and sought protection

on the Sumatran shore. They represented, that arriving off Pasay, they had been ill treated by the natives, who killed one of their party, and obliged them to fly to Pedeer, where they met with hospitality and kindness from the prince, who seemed desirous to conciliate the regard of their nation. Alboquerque expressed himself sensible of this instance of friendship, and renewed with the fultan the alliance that had been formed by Sequeira. He then proceeded to Pafay, whose monarch endeavored to exculpate himself from the outrage committed against the Portuguese fugitives, and as he could not tarry to take redress, he concealed his resentment. In crossing over to Malacca, he fell in with a large junk, or country veffel, which he engaged, and attempted to board; but the enemy fetting fire to a quantity of inflammable, oleaginous matter, he was deterred from his defign, with a narrow escape of the destruction of his own ship. The junk was then battered from a distance, until forty of her men were killed, when Alboquerque, admiring the bravery of the crew, proposed to them, that if they would firike, and acknowledge themselves vasfals of Portugal, he would treat them as friends, and take them under his protection. This offer was accepted, and the valiant defender of the veffel informed the governor, that his name was Geinal*, the lawful heir of the kingdom of Pasay; he by whom it was then ruled being an usurper, who taking advantage of his minority, and his own fituation as regent, had feized the crown: that he had made attempts to affert his rights, but had been defeated in two battles, and was now proceeding with his adherents to Java, fome of the princes of which were his relations, and would, he hoped, enable him to obtain possession of his throne. Alboquerque promised to effect it for him, and defired the prince to accompany him to Malacca, where they arrived the first of July, 1511.

In order to fave the lives of the Portuguese prisoners, and if possible to effect their recovery, he negotiated with the king of Malacca, before he proceeded to an attack on the place; which conduct of his, Geinal

the made their escape suirolo of gnibal recording to Protection

construed

1511.

construed into fear, and forfaking his new friend, he passed over in the night to the Malay monarch, whose protection he thought of more confequence to him. When Alboquerque had fubdued the place, which made a vigorous refistance, the prince of Pasay, seeing the error of his policy, returned, and threw himfelf at the governor's feet, acknowledged his injurious mistrust, and implored his pardon; which was not denied him. He doubted however, it feems, of a fincere reconciliation and forgiveness, and perceiving that no measures were taking for restoring him to his kingdom, but on the contrary that Alboquerque was preparing to leave Malacca with a small force, and talked of effecting his promise when he should return from Goa, he took the resolution of again attaching himself to the fortunes of the conquered monarch, and fecretly collecting his dependents, fled once more from the protection of the Portuguese. He probably was not insensible that the reigning king of Pasay, his adversary, had for some time taken abundant pains to procure the favor of Alboquerque, dreading the effects of his power, and had embraced every opportunity of recommending h mfelf to his friendthip. An occasion offered of demonstrating his zeal. Alboquerque on his return from Malacca, met with a violent storm on the coast of Sumatra, near the point of Timiang, where his ship was wrecked. Part of the crew making a raft were driven to Pasay, where the king treated them with kindness, and sent them to the coast of Coromandel, by a merchant ship. Some years after these events, Geinal was enabled by his friends to carry a force to Pafay, and obtained the afcendency there. but did not long enjoy his power.

Upon the reduction of Malacca, the governor received messages from several of the Sumatran princes, and among the rest from the king of a place called Campar, on the eastern coast, who had married a daughter of the king of Malacca, but was on ill terms with his father-in-law. He desired to become a vassal of the Portuguese crown, and to have leave to reside under their jurisdiction. His view was to obtain the important office of Bandara, or chief magistrate of the Malays, lately vacant by the execution of him who possessed it. He sent before him a present

of lignum aloes and gum lac, the produce of his country; but Albo-

querque suspecting the honesty of his intentions, and fearing that he either aspired to the crown of Malacca, or designed to entice the merchants to refort to his own kingdom, refused to permit his coming, and gave the superintendance of the natives to a person named Nina Chetuan. After some years had elapsed, at the time when Jorge Alboquerque was governor of Malacca, this king (Abdallab by name) perfifting in his views, paid him a vifit, and was honorably received. At his departure, he had affurances given him of liberty to establish himfelf at Malacca, if he should think proper, and Nina Chetuan was shortly afterwards removed from his office, though no fault was alledged against him. He took the disgrace so much to heart, that causing a pile to be erected before his door, and fetting fire to it, he threw himfelf into the flames.* The intention of appointing Abdallah to the office of bandara, was quickly rumoured abroad, and coming to the knowledge of the king of Bintang, who was driven from Malacca, and now carried on a vigorous war against the Portuguese, under the command of the famous Lacfemanna, he refolved to prevent his arrival there. For this purpose he leagued himself with the king of Lingen, a neighbouring island, and fent out a fleet of seventy armed boats to block up the port of Campar. By the valor of a small Portuguese armament, this force was overcome in the river of that name, and the king conducted in triumph to Malacca, where he was invested in form with the important post he aspired to. But this sacrifice of his independence proved an unfortunate measure to him; for although he conducted himself in such a manner as should have given the amplest satisfaction, and appears to have been

* This man was not a Mahometan, but one of the unconverted natives of the peninfula, who are always diffinguished from the Malays by the Portuguese writers. I have some doubt whether the term Malayo is at all applicable to the inland people, or their country.

the king of Bintang found means to inspire the governor with diffi-

dence of his fidelity, and jealoufy of his power. He was cruelly fentenced to death, without the fimplest forms of justice, and perished in

the

#515·

3514

the presence of an indignant multitude, whilst he called heaven to witnefs his innocence, and direct it's vengeance against his interested accufers. This iniquitous and impolitic proceeding had fuch an effect upon the minds of the people, that all of any property or repute, forfook the place, execrating the government of the Portuguese. The confequences of this general odium reduced them to extreme difficulties for provisions, which the neighbouring countries refused to supply them with, and but for fome grain at length procured from Siak, with much trouble, the event had proved fatal to the garrison.

Fernando Perez d'Andrade, in his way to China, touched at Pasay, 1516. in order to take in pepper. He found the people of the place, as well as the merchants from Bengal, Cambay, and other parts of India, much discontented with the measures then pursuing by the government of Malacca, which had stationed an armed force to oblige all vessels to refort thither with their merchandize, and take in at that place, as an emporium, the cargoes they were used to collect in the straits. The king, notwithstanding, received Andrade well, and consented that the Portuguese should have liberty to erect a fortress in his kingdom.

Extraordinary accounts having been related of certain islands abounding in gold, which were reported by the general fame of India, to lie off the fouthwest coast of Sumatra, a ship and small brigantine, under the command of Diogo Pacheco, an experienced seaman, were sent in order to make the discovery of them. Having proceeded as far as Daya, the brigantine was loft in a gale of wind. Pacheco flood on to Baroos, a place much noted for it's gold trade, and for gum benjamin of a peculiar fcent which the country produced. It was much frequented by veffels, both from the neighbouring ports in the island, and from those in the West of India, whence they were supplied with cotton cloths. The merchants, terrified at the approach of the Portuguese, forfook their ships, and fled precipitately to the shore. The chiefs of the country fent to enquire the motives of his vifit, which he informed them were to establish friendly connexions, and to give them

affurances of unmolested freedom of trade at the city of Malacca. Refreshments were then ordered for his fleet, and upon landing he was treated with respect by the inhabitants, who brought the articles of their country to exchange with him for merchandize. His chief view was to obtain information respecting the fituation and other circumstances of the ilbas d'Ouro; but they feemed jealous of imparting it, and at length gave him a labored detail of the dangers attending the navigation of the feas where they were faid to lie, which was an hundred leagues to the foutheast of Baroos, amidst labyrinths of shoals and reefs, through which it was impossible to steer with any but the smallest boats. If these iflands, fo celebrated about this time, existed any where but in the regions of fancy,* they were probably those called the Ticoos, to which it is possible that much gold might be brought from the neighbouring country of Menangcabow. Pacheco leaving Baroos, proceeded to the fouthward, but did not make the wished for discovery. He reached the channel that divides Sumatra from Java, which he called the strait of Polimban, from a city he erroneously supposed to lie on the Java shore, and paffing through this, returned to Malacca by the east; being the first European who failed round the island of Sumatra. In the following year he failed once more in fearch of these islands, which were afterwards the object of many fruitless voyages; but touching again at Baroos, he met with refistance there, and perished with all his companions.

A little before this time a ship under the command of Gaspar d'Acosta was lost on the island of Gamispola (poolo Gomez) near Acheen head, when the people from Acheen attacked and plundered the crew, killing many, and taking the rest prisoners. A ship also which belonged to Joano de Lima was plundered in the road, and the Portuguese which belonged to her put to death. These insults, and others committed at Pasay, induced the governor of Malacca, Garcia de Sa, to dispatch a vessel under Manuel

^{*} Linschoten makes particular mention of having seen them, and gives practical directions for the navigation, but the golden dreams of the Portuguese were never realized in them.

Pacheco, to take satisfaction; which he endeavoured to effect by blocking up the ports, and cutting off from the towns all sources of provision, particularly their sisheries. As he cruised between Acheen and Pasay, a boat with five men going to take in fresh water at a river near the latter, was nigh being cut off, had not the people, by wonderful efforts of valor, overcome the numerous party which attacked them. The sultan, alarmed for the consequences of this affray, sent immediately to sue for reconciliation, offering to make reparation for the loss of property the merchants had sustained by the licentiousness of his people, from a participation in whose crimes he endeavoured to vindicate himself. The advantage derived from the connexion with this place, induced the government of Malacca to be satisfied with his apology, and cargoes of pepper and raw silk were shortly after procured there; the former being much wanted for the ships bound to China.

Geinal who had fled to the king of Malacca, as before mentioned, followed that monarch to the island of Bintang, and received one of his daughters in marriage. Six or feven years elapfed before the fituation of affairs enabled the king to lend him any effectual affiftance, but at length fome victories gained over the Portuguese afforded a proper opportunity, and accordingly a fleet was fitted out, with which Geinal failed for Pasay. In order to form a judgment of the transactions of this kingdom, it must be understood, that the people having an idea of predestination, always conceived present possession to constitute right. however that poffession might have been acquired: but yet they made no fcruple of depofing and murdering their fovereigns, and juffified their acts by this argument; that the fate of concerns fo important as the lives of kings, was in the hands of God, whose vicegerents they were. and that if it was not agreeable to him, and the consequence of his will. that they should perish by the daggers of their subjects, it could not so happen. Thus it appears that their religious ideas were just strong enough to banish from their minds every moral sentiment. The natural consequence of these maxims was, that their kings were merely the tyrants of the day; and it is faid that whilft a certain ship remained

in the port, no less than two were murdered and a third set up: but allowance should perhaps be made for the medium through which these accounts have been transmitted to us.

The maternal uncle of Geinal, who, on account of his father's infirmities, had been fome time regent, and had deprived him of the fuccession to the throne, was also king of Aru (Rou) a country not far distant, and thus became monarch of both places. The caprices of the Pafay people, who submitted quietly to his usurpation, rendered them ere long discontented with his government, and being a stranger they had the less compunction in putting him to death. Another king was fet up in his room, who foon fell by the hands of fome natives of Aru who refided at Pasay, in revenge for the affassination of their countryman. A fresh monarch was elected by the people, and in his reign it was that Geinal appeared with a force from Bintang, who carrying every thing before him, put his rival to death, and took possession of the throne. The fon of the deceased, a youth of about twelve years of age, made his escape, accompanied by the chief priest of the city, named Moulana,* and procured a conveyance to the west of India. There they threw themfelves at the feet of the Portuguese governor, Lopez Sequeira, then engaged in an expedition to the Red Sea, imploring his aid to drive the invader from their country, and to establish the young prince in his rights, who would thenceforth confider himself as a vaffal of the crown of Portugal. It was urged that Geinal, as being nearly allied to the king of Bintang, was an avowed enemy to that nation, which he had manifested in some recent outrages committed against the merchants from Malacca who traded at Pasay. Sequeira, partly from compassion, and partly from political motives, refolved to fuccour this prince, and by placing him on the throne, establish a firm interest in the affairs of his kingdom. He accordingly gave orders to Jorge Alboquerque, who was then proceeding with a ftrong fleet towards Malacca, to take the youth with him, whose

1519.

^{*} Moulana is a word fignifying a certain rank of the priesthood, and has been mistaken for a proper name.

name was Orfacam,* and after having expelled Geinal from the fovereignty, to put him in possession of it.

willing to confider himself as the valid of the king of Portugal, and to

When Geinal entered upon the administration of the political concerns of the kingdom, although he had promifed his father-in-law to carry on the war in concert with him, yet being apprehensive of the effects of the Portuguese power, he judged it more for his interest to seek a reconciliation with them, than to provoke their resentment, and in pursuance of that system, had so far recommended himself to Garcia de Sa, the governor of Malacca, that he formed a treaty of alliance with him. This was, however, soon interrupted, and chiefly by the imprudence of a man named Diogo Vaz, who made use of such insulting language to the king, because he delayed payment of a sum of money he owed him, that the courtiers, seized with indignation, immediately stabbed him with their creeses, and the alarm running through the city, others of the Portuguese were likewise murdered. The news of this affair reaching Goa, was an additional motive for the resolution taken of dethroning Geinal.

Jorge d'Alboquerque arrived at Pasay in 1521, with prince Orfacam, and the inhabitants came off in great numbers to welcome his return. The king of Aru had brought thither a considerable force the preceding day, designing to take satisfaction for the murder of his relation, the uncle of Geinal †, and now proposed to Alboquerque that they should make the attack in conjunction, who thought proper to decline it. Geinal, although he well knew the intention of the enemy, yet sent a friendly message to Alboquerque, who in answer required him to relinquish his crown in favour of him whom he styled the lawful prince. He then represented to him the injustice of attempting to force him from the

521.

^{*} Evidently corrupted, as are most of the country names and titles; which shews that the Portuguese were not at this period much conversant in the Malay language.

[†] The revolutions at Pasay were so quick, that when an injury was committed against any foreign power, their forces could never take revenge before another prince had ascended the throne.

4 P possession

poffession of what was his, not only by right of conquest, but of hereditary descent, as was well known to the governor himself: that he was willing to confider himself as the vassal of the king of Portugal, and to grant every advantage in point of trade, that they could expect from the administration of his rival: that fince his obtaining the crown he had manifested the utmost friendship to the Portuguese, for which he appealed to the treaty formed with him by the government of Malacca, and which was not disturbed by any fault that could in justice be imputed to him. These arguments, like all others that pass between states which harbour inimical defigns, had no effect upon Alboquerque, who after reconnoitring the ground, gave orders for the attack. Geinal was now fensible that there was nothing left for him but to conquer or die, and refolved to defend himself to extremity, in an intrenchment he had formed at some distance from the town of Pasay, where he had never yet ventured to refide, as the people were in general incenfed against him on account of the destruction of the late king of their choice. For though they were ever ready to demolish those whom they disliked, yet were they equally zealous to facrifice their own lives, in the cause of those whom they were attached to. The Portuguese force confisted but of three hundred men, yet fuch was the superiority they possessed in war over the inhabitants of these countries, that they entirely routed Geinal's army which amounted to three thousand, with many elephants, although they fought bravely. When he fell, they became dispirited, and the people of Aru joining on the pursuit, a dreadful flaughter succeeded, and upwards of two thousand Sumatrans lay dead, with the loss of only five or fix Europeans; but feveral were wounded, among whom was Alboquerque himself.

The next measure was to place the young prince upon the throne, which was performed with much ceremony. Moulana the priest was appointed his governor, and Nina Cunapam, who in several instances had shewn a friendship for the Portuguese, was continued in the office of Shabandar. It was stipulated that the prince should do homage to the crown of Portugal; give a grant of the whole produce of pepper

of his country at a certain price; and defray the charges of a fortress which they then prepared to erect in his kingdom, and of which Miranda d'Azeuedo was appointed captain, with a garrison of an hundred foldiers. The materials were mostly timber, which the ruins of Geinal's intrenchment supplied them with. After Alboquerque's departure, the works had nearly fallen into the hands of an enemy named Melique Ladil, who called himself fultan of Pasay, and made several desultory attacks upon them; but he was at length totally routed, and the fortifications were compleated without further molestation.

A fleet which failed from the west of India a short time after that of Alboquerque, under the command of Jorge de Brito, stopt in the road of Acheen, in their way to the Molucca islands. There was at this time at Acheen a man of the name of Joano Borba, who spoke the language of the country, having formerly fled thither from Pasay, at the time Diogo Vaz was affaffinated. Being afterwards entrusted with the command of a trading veffel from Goa, which foundered at fea, he again escaped to this place, with nine men in a small boat, and was hospitably received by the king, when he learned that the ship had been destined to his port. Borba came off along with a meffenger fent by the king to welcome the commander, and offer him refreshments for his fleet, and being a man of extraordinary loquacity, he gave a description to Brito of a temple in the country in which was deposited a large quantity of gold: he mentioned likewise that the king was in possession of the artillery and merchandize of Gaspar d'Acosta's vessel, some time since wrecked there: and also of the goods saved from a brigantine driven on shore at Daya, in Pacheco's expedition; as well as of Joano de Lima's ship, which he had caused to be cut off. Brito being tempted by the golden prize, which he conceived already in his power, and inflamed by Borba's reprefentation of the king's iniquities, fent a meffage in return, to demand the restitution of the artillery, ship, and goods, which had been unlawfully feized. The king replied, that if he wanted those articles to be refunded, he must make his demand to the sea which had swallowed them up. Brito and his captains now resolved to proceed to an attack upon

the place, and fo fecure did they make themselves of their prey, that they refused permission to a ship lately arrived, and which did not belong to their fquadron, to join them or participate in the profits of their adventure. They prepared to land two hundred men in small boats; a larger, with a more confiderable detachment and their artillery, being ordered to follow. About day break they had proceeded half way up the river, and came near to a little fort defigned to defend the paffage, where Brito thought it advisable to stop till the remainder of their force should join them; but being importuned by his people, he left a party of fifty men to facilitate the landing, and advanced to make himself mafter of the fort, which was readily effected. Here he again refolved to make his stand, but by the imprudence of his ensign, who had drawn fome of the party into a skirmish with the Achenese, he was forced to quit that post in order to save his colors which were in danger. At this juncture the king appeared at the head of eight hundred or a thoufand men, and fix elephants. A desperate conflict ensued, in which the Portuguese received considerable injury. Brito sent orders for the party he had left to come up, and endeavored to retreat to the fort, but he found himself so situated, that it could not be executed without much lofs, and prefently after he received a wound from an arrow through the cheeks. No affistance arriving, it was proposed that they should retire in the best manner they could to their boats; but that Brito would not consent to, preferring death to flight. Immediately upon this a lance pierced his thighs, and he fell to the ground. The Portuguese, rendered desperate, renewed the combat with redoubled vigor, all crowding to the spot where their commander lay, but their exertions availed them nothing against such unequal force, and they only rushed on to facrifice. Almost every man was killed, and among these were near fifty perfons of family, who had embarked as volunteers. Those who escaped belonged chiefly to the corps de reserve, who did not, or could not, come up in time to fuccour their unfortunate companions. Upon this merited defeat, the fquadron immediately weighed anchor, and after falling in with two veffels bound on the discovery of the ilbas d'Ouro, arrived at Pasay, where they found Alboquerque employed in the conftruction

ftruction of his fortress, and went with him to make an attack on Bin-

At the time that Malacca fell into the hands of the Portuguese, Acheen and Daya were provinces subject to Pedeer, and governed by two flaves belonging to the fultan of that place, to each of whom he had given a niece in marriage. It must be understood that slaves are in that country on a different footing from those in most other parts of the world, and usually treated as children of the family. It frequently happened also that men of good birth, finding it necessary to obtain the protection of fome person in power, became voluntary slaves for this purpose. The nobles, being proud of the fervice of fuch dependents, encouraged the practice by treating them with a degree of respect, and in many instances they made them their heirs.* A flave of this description who held the government of Acheen, had two fons, the elder of whom was named Raja Abraham, and the younger Raja Lella, and were brought up in the house of their master. The father being old was recalled from his post, but on account of his faithful services, the sultan gave the fuccession to his eldest son, who appears to have been a youth of an ambitious and very fanguinary temper. A jealoufy had taken place between him and the chief of Daya, whilst they were together at Pedeer, and as foon as he came into power he refolved to feek revenge, and with that view entered in a hostile manner the district of his rival. When the fultan interposed, it not only added fuel to his refentment, but inspired him with hatred towards his master, and he shewed his disrespect by refusing to deliver up on the requisition of the sultan, certain Portuguese prisoners taken from a vessel lost at Poolo Gomez, and which he afterwards complied with at the intercession of the Shabandar of Pasay. This conduct manifesting an intention of entirely throwing off his allegiance, his father endeavored to recall him to a fense of his duty, by representing the obligations in which the family were

^{*} The fame custom prevails at Acheen to this day. These slaves who are often Moors from the West of India, trade for their masters, and have a certain proportion of the profits, residing in a separate quarter of the city.

indebted to the fultan, and the relationship which so nearly connected them. But so far was this admonition from producing any good effect, that he took offence at his father's presumption, and ordered him to be confined in a cage, where he died. Irritated by these acts, the sultan resolved to proceed to extremities against him; but by means of the plunder of some Portuguese vessels, as before related, and the recent defeat of Brito's party, he became so strong in artillery and ammunition, and so much elated with success, that he set his master at desiance, and prepared to defend himself. His force proved superior to that of Pedeer, and in the end he obliged the sultan to sly for resuge and affistance to the European fortress at Pasay, accompanied by his nephew the chief of Daya, who was also forced from his possessions.

1522.

1521.

Abraham had for some time infested the Portuguese by sending out parties against them, both by sea and land; but these being always baffled in their attempts with much loss, he began to conceive a violent antipathy against that nation, which he ever after indulged to excess. He got possession of the city of Pedeer by bribing the principal officers; a mode of warfare that he often found successful, and seldom neglected to attempt. These he made to write a letter to their master couched in artful terms, in which they requested he would come to their affistance with a body of Portugeuse, as the only chance of repelling the enemy by whom they pretended to be invested. The fultan shewed this letter to André Henriquez, then governor of the fort, who thinking it a good opportunity to chaftise the Achenese, sent by sea a detachment of eighty Europeans and two hundred Malays, under the command of his brother Manuel, whilft the fultan marched over land with a thousand men, and fifteen elephants, to the relief of the place. They arrived at Pedeer in the night, but being fecretly informed that Abraham was master of the city, and that the demand for fuccour was a stratagem, they endeavoured to make their retreat; which the land troops effected, but before the tide would enable the Portugeuse to get their boats afloat, they were attacked by Abraham's people, who killed Manuel and thirty five of his men.

Henriquez

Henriquez perceiving his fituation at Pafay was becoming critical. not only from the force of the enemy, but the fickliness of his garrison, and the want of provisions, which the country people now witheld from them, discontinuing the fairs that they were used to keep three times in the week, dispatched advices to the governor of India, demanding immediate fuccours, and also fent to request affistance of the king of Aru. who had always proved the stedfast friend of Malacca, and who, though not wealthy, because his country was not a place of trade, was yet one of the most powerful princes in those parts. The king expressed his joy in having an opportunity of ferving his allies, and promifed his utmost aid; not only from friendship to them, but indignation against Abraham, whom he regarded as a rebellious flave. A fupply of flores 1523. at length arrived from India, under the charge of Lopo d'Azuedo, who had orders to relieve Henriquez in the command; but disputes having arisen between them, and chiefly on the subject of certain works which the shabandar of Pasay had been permitted to erect adjoining to the fortress, d'Azuedo, to avoid coming to an open rupture, departed for Malacca. Abraham having found means to corrupt the honesty of this fhabandar, who had received his office from Alboquerque, gained intelligence through him of all that paffed. This treason it is supposed he would not have yielded to, but for the desperate situation of affairs. The country of Pasay was now entirely in subjection to the Achenese. and nothing remained unconquered but the capital; whilft the garrison was distracted with internal divisions.

After the acquifition of Pedeer, Abraham thought it necessary to remain there some time in order to confirm his authority, and fent his brother Raja Lella with a large army to reduce the territories of Pafay, which he effected in the course of three months, and with the more facility, because that all the principal nobility had fallen in the action with Geinal. He fixed his camp within half a league of the city, and gave notice to Abraham of the state in which matters were, who speedily joined him, being anxious to render himfelf mafter of the place, before the promised succours from the king of Aru could arrive. His first step

was to iffue a proclamation, giving notice to the people of the town, that whoever should submit to his authority within fix days, should have their lives, families, and properties secured to them, but that all others must expect to feel the punishment of their obstinacy. This had the effect he looked for, the greater part of the inhabitants coming over to his camp. He then commenced his military operations, and in the third attack got possession of the town of Pasay, after much slaughter; those who escaped his sury taking shelter in the neighbouring mountains and thick woods. He sent a message to the commander of the fortress, requiring him to abandon it, and to deliver into his hands the kings of Pedeer and Daya, to whom they had given protection. Henriquez returned a spirited answer to this summons, but being sickly at the time; at best of an unsteady disposition; and too much attached to his trading concerns, for a soldier, he resolved to relinquish the command to his relation Aires Coelho, and take passage for the West of India.

1523.

He had not advanced farther on his voyage than the point of Pedeer, when he fell in with two Portuguese ships bound to the Moluccas, the captains of which he made acquainted with the fituation of the garrifon, and they immediately proceeded to its relief. Arriving in the night they heard great firing of cannon, and learned next morning that the Achenese had made a furious affault, in hopes of carrying the fortress, before the ships, which were descried at a distance, could throw succours into it. They had mastered some of the outworks, and the garrison reprefented that it was impossible for them to support such another shock, without aid from the veffels. The captains, with as much force as could be spared, entered the fort, and a fally was shortly afterwards refolved on and executed, in which the befiegers fuffained much damage. Every effort was likewife employed, to repair the breaches, and stop up the mines that had been made by the enemy in order to effect a paffage into the place. Abraham now attempted to draw them into a snare by removing his camp to a diffance, and making a show of abandoning his enterprize; but this stratagem proved ineffectual. Reflecting then with indignation, that his own force confifted of fifteen thousand men, whilft

whilst that of the Europeans did not exceed three hundred and fifty. many of whom were fick and wounded, and others worn out with the fatigue of continual duty; intelligence whereof was furnished him; he resolved once more to return to the siege, and make a general affault upon all parts of the fortification at once. Two hours before day break he caused the place to be furrounded with eight thoufand men, who approached in perfect filence. The night time was preferred by those people for making their attacks, as being then most fecure from the effect of fire arms, and they also generally chose a time of rain, when the powder would not burn. As foon as they found themselves perceived, they set up a hideous shout, and fixing their scaling ladders, made of bamboo and wonderfully light, to the number of fix hundred, they attempted to force their way through the embrafures for the guns; but after a strenuous contest they were at length repulsed. Seven elephants were driven with violence against the paling of one of the bastions, which gave way before them like a hedge, and overset all the men who were on it. Javelins and pikes these enormous beafts made no account of, but upon fetting fire to powder under their trunks, they drew back with precipitation, in spite of all the efforts of their drivers : overthrew their own people; and flying to the distance of several miles. could not again be brought into the lines. The Achenese upon receiving this check thought to take revenge, by fetting fire to some veffels that were in the dock yard; but this proved an unfortunate measure to them, for by the light which it occasioned, the garrison were enabled to point their guns, and did abundant execution.

Henriquez, after beating some time against a contrary wind, put back to Pasay, and coming on shore the day after this conslict, refumed his command. A council was foon after held, to determine what measures were fittest to be pursued in the present situation of affairs, and taking into their confideration that no further affistance could be expected from the West of India in less than fix months; that the garrison was fickly. and provisions short, it was resolved, by a majority of votes, to abandon 1524. the place, and measures were taken accordingly. In order to conceal

their intentions from the enemy, they ordered such of the artillery and stores as could be removed conveniently, to be packed up in the form of merchandize, and then shipped off. A party was left, to set fire to the buildings, and trains of powder were fo disposed as to lead to the larger cannon, which they over charged, that they might burft as foon as heated. But this was not effectually executed, and the pieces mostly fell into the hands of the Achenese, who upon the first alarm of the evacuation, rushed in, extinguished the flames, and turned upon the Portuguese their own artillery, many of whom were killed in the water, as they hurried to get into their boats. They now lost as much credit by this ill conducted retreat, as they had acquired by their gallant defence, and were insulted by the reproachful shouts of the enemy; whose power was greatly encreased by this acquisition of military stores, and of which they often feverely experienced the effects. To render their difgrace more striking, it happened that as they failed out of the harbour, they met thirty boats laden with provisions for their use from the king of Aru, who was himself on his march overland with four thousand men: and when they arrived at Malacca they found troops and stores embarked there for their relief. The unfortunate princes who had fought an afylum with them, now joined in their flight; the fultan of Pafay proceeded to Malacca, and the fultan of Pedeer, and chief of Daya took refuge with the king of Aru.

1525.

Raja Narra king of Indergeree, in conjunction with a force from Bintang, attacked the king of a neighbouring island called Lingen, who was in friendship with the Portuguese. A message which passed on this occasion gives a just idea of the style and manners of this people. Upon their acquainting the king of Lingen, in their summons of surrender, that they had lately overcome the fleet of Malacca, he replied that his intelligence informed him of the contrary; that he had just made a festival and killed sifty goats to celebrate one defeat which they had received, and hoped soon to kill an hundred, in order to celebrate a second. His expectations were sulfilled, or rather anticipated, for the Portuguese having a knowledge of the king of Indergeree's design, sent

out a small fleet which routed the combined force, before that the king of Lingen was acquainted with their arrival; his capital being fituated high up on the river. In the next year, at the conquest of Bintang, this king, unfolicited, fent affistance to his European allies, a language and synd

A boat was fent ahead of this fleet with a figual of peace, and affurances

1526.

1527.

However well founded the accounts may have been which the Portuguese have given us of the cruelties committed against their people by the king of Acheen, the barbarity does not appear to have been only on one fide. Francisco de Mello being sent in an armed vessel with dispatches to Goa, met, near Acheen head, with a ship of that nation just arrived from Mecca, and supposed to be richly laden. As she had on board three hundred Achenese and forty Arabs, he dared not venture to board her, but battered her at a distance, when suddenly she filled and funk, to the extreme disappointment of the Portuguese, who thereby loft their prize; but they wreaked their vengeance on the unfortunate crew, as they endeavoured to fave themselves by swimming, and boast that they did not fuffer a man to escape. Opportunities of retaliation foon offered. b stoom and his need of Manue of one

Simano de Soufa going with a reinforcement to the Moluccas from Cochin, was overtaken in the bay by a violent storm, which forced him to flow many of his guns in the hold; and having loft feveral of his men through fatigue, he made for the nearest port he could take shelter in. which proved to be Acheen. The king having the destruction of the Portuguese at heart, and resolving if possible to seize their vessel, sent off a meffage to De Soufa recommending his standing in closer to the shore. where he would have more shelter from the gale which still continued, and lie more conveniently for getting off water and provisions; at the same time inviting him to land. This artifice not fucceeding, he ordered out the next morning a thousand men in twenty boats, who at first pretended that they were come to affift in mooring the ship; but the captain, aware of their hostile defign, fired amongst them, when a fierce engagement

die edex nothing from his plans of retenge, he hallened to dif-

took place, in which the Achenese were repulsed with great slaughter. but not until they had destroyed forty of the Portuguese. The king enraged at this disappointment, ordered a second attack, threatening to have his admiral trampled to death by elephants if he failed of fuccess. A boat was fent ahead of this fleet with a fignal of peace, and affurances to De Sousa, that the king, as soon as he was made acquainted with the injury that had been committed, had caused the perpetrators of it to be punished, and now once more requested him to come on shore and trust to his honor. This proposal some of the crew were inclined that he should accept, but being animated by a speech that he made to them, it was refolved that they should die with arms in their hands, in preference to a difgraceful and hazardous submission. The combat was therefore renewed, with extreme fury on the one fide, and uncommon efforts of courage on the other, and the affailants were a fecond time repulsed; but one of those who had boarded the vessel and afterwards made his escape, represented to the Achenese the reduced and helpless fituation of their enemy, and fresh supplies coming off, they were encourged to return to the attack. De Soufa and his people were at length almost all cut to peices, and those who survived, being desperately wounded, were overpowered, and led prisoners to the king, who unexpectedly treated them with extraordinary kindness, in order to cover the defigns he harboured, and pretended to lament the fate of their brave commander. He directed them to fix upon one of their companions, who should go in his name to the governor of Malacca, to defire he would immediately fend to take possession of the ship, which he meant to restore, as well as to liberate them. He hoped by this artifice to draw more of the Portuguese into his power, and at the same time to effect a purpose of a political nature. A war had recently broke out between him and the king of Aru, the latter of whom had deputed embaffadors to Malacca, to folicit affiftance, in return for his former fervices; and which was readily promifed to him. It was highly the interest of Abraham to prevent this junction, and therefore, though determined to relax nothing from his plans of revenge, he haftened to difpatch Antonio Caldeira, one of the captives, with propofals of accommodation

modation and alliance, offering to restore not only this vessel, but also the artillery which he had taken at Pasay. These terms appeared to the governor too advantageous to be rejected. Conceiving a favorable idea of the king's intentions, from the considence which Caldeira, who was deceived by the humanity shewn to the wounded captives, appeared to to place in his sincerity, he became deaf to the representations that were made to him by more experienced persons, of Abraham's insidious character. A message was sent back agreeing to accept his friendship on the proposed conditions, and engaging to withold the promised succours from the king of Aru. Caldeira, in his way to Acheen, touched at an island where he was cut off, with those who accompanied him. The embassadors from Aru being acquainted with this breach of faith, retired in great disgust, and the king, incensed at the ingratitude shewn him, concluded a peace with Acheen; but not till after an engagement between their fleets had taken place, in which the victory remained undecided.

In order that he might learn the causes of the obscurity in which his negotiations with Malacca refted, Abraham dispatched a secret messenger to Senaia Raja, Bandara of that city, with whom he held a correfpondence; defiring also to be informed of the strength of the garrison. Hearing in answer, that the governor newly arrived was inclined to think favorably of him, he immediately fent an ambaffador to wait on him, with affurances of his pacific and friendly disposition; who returned in company with persons empowered on the governor's part, to negotiate a treaty of commerce. These, on their arrival at Acheen, were loaded with favors and costly presents; the news of which quickly flew to Malacca; and the bufiness they came on being adjusted, they were suffered to depart; but they had not failed far before they were overtaken by boats fent after them, and were stript, and murdered. The governor, who had heard of their fetting out, concluded they were loft by accident. Intelligence of this mistaken opinion was transmitted to Abraham, who thereupon had the audacity to request that he might be honored with

the presence of some Portuguese of rank and consequence in his capital, to ratify in a becoming manner the articles that had been drawn up, as he ardently wished, to see that nation trafficking freely in his dominions The deluded governor, in compliance with this request, adopted the refolution of fending thither a large ship, under the command of Manuel Pacheco, with a rich cargo, the property of himself and several merchants of Malacca, who themselves embarked, with the idea of making extraordinary profits. Senaia conveyed notice of this preparation to Acheen, informing the king at the same time, that if he could make himfelf master of this vessel, Malacca must fall an easy prey to him, as the place was weakened of half its force for the equipment. When Pacheco approached the harbour he was furrounded by a great number of boats, and some of the people began to suspect treachery, but so strongly did the spirit of delusion prevail in this business, that they could not perfuade the captain to put himself on his guard. He soon had reason to repent his credulity. Perceiving an arrow pass close by him, he haftened to put on his coat of mail, when a fecond pierced his neck, and he foon expired. The veffel then became an easy prey, and the people being made prisoners, were shortly afterwards massacred by the king's order, along with the unfortunate remnant of De Sousa's crew, so long flattered with the hopes of release. By this capture Abraham was supposed to have remained in possession of more artillery than was left in Malacca, and he immediately fitted out a fleet to take advantage of it's exposed state. The pride of success causing him to imagine it already in his power, he fent a taunting meffage to the governor, in which he thanked him for the late instances of his liberality, and let him know he should trouble him for the remainder of his naval force.

Senaia had promifed to put the citadel into his hands, and this had certainly been executed but for an accident that discovered his treasonable designs. The crews of some vessels of Abraham's sleet, landed on a part of the coast not far from the city, where they were well entertained by the natives, and in the openness of conviviality, related the transactions which had lately passed at Acheen, the correspondence of Senaia,

3529.

and the scheme that was laid for rising on the Portuguese when they should be at church, murdering them, and seizing the fortress. Intelligence of this was reported with speed to the governor, who had Senaia instantly apprehended and executed. This punishment served to intimidate those among the inhabitants who were engaged in the conspiracy and disconcerted the plans of the king of Acheen.

These appear to be the last transactions of Abraham's reign, of which any mention is made by historians. The time of his death is not satisfactorily ascertained, but it is said that he was dispatched with poison given him by his wife, who was sister to the chief of Daya, in revenge for the injuries her brother had sustained at his hand.*

He was fucceeded by one who styled himself Siry Sultan Alradin, is king of Acheen, Baroos, Pedeer, Pasay, Daya, and Batta, prince of the land of the two seas, and of the mines of Menangcabow. Nothing is recorded of his reign until the year 1537, in which he twice attacked Malacca. The first time he sent an army of three thousand men, who landed near the city by night, unperceived of the Portuguese, and having committed some ravages in the suburbs, were advancing to the bridge, when the governor, Estavano de Gama, sallied out with a party and obliged them to retreat for shelter to the woods. Here they defended themselves during the next day, but on the following night they re-embarked, with the loss of sive hundred men. A few months afterwards the king had the place invested with a larger force; but in the interval the works had been repaired and strengthened, and after three days inessectual attempt, the Achenese were again constrained to retire.

1537

c Castanheda. Diogo do Couto.

^{*} De Barros places his death in 1528, but the accounts of the transactions of the following year contradict that date. Probably the event took place in 1529 or 1530.

⁺ Radin is a name often found amongst the Malays, to which the Arabic particle is here pre-

d De Barros,

2539-

In the 1539 we find Alradin engaged in a war with his neighbour a king of Batta, named Angee Siry Timor raja. The cause of their quarrel was the latter's refusing to become a Mahometan at the requisition of the former. A battle was fought in which the Achenese monarch was worsted, and peace was concluded on the condition of his paying a certain fum of gold to the victor; but a supply of three hundred Arab troops, with a quantity of stores, arriving at this time, he did not hefitate to break the treaty, and falling upon fome towns belonging to the Batta king, he put to death three of his fons and a number of his principal warriors. Irritated by this treachery, Timor raja made a vow not to taste fruit or falt, till he should have revenge. He raised an army of fifteen thousand men, feven thousand of which were auxiliaries from the countries of Menangcabow, Indergeree, Jambee, Luson, and Borneo, and fent a request to the governor of Malacca for aid, who furnished him with arms and ammunition, as against a common enemy. With this force, and forty elephants, he marched towards Acheen, and not far from that place encountered his adverfary, when a bloody engagement enfued, in the event of which Alradin was obliged to retire, after lofing fifteen hundred of his men, among whom were faid to be an hundred and fixty Turks, with two hundred Saracens, Malabars, and Abyfinians. The Batta king purfued him to the city, which he continued to befiege during three and twenty days; but lofing many of his people, and hearing that a fleet was off the port, in which was an army of Acheen returning from an expedition against the king of Siam, he thought it prudent to make a hasty retreat to his own country, where he arrived on the fifth day.d

In the latter end of the same year a messenger arrived at Malacca from the king of Aru, to solicit succours against the king of Acheen, who was preparing a powerful force to invade his dominions, in order that by possessing this kingdom, which lay opposite to Malacca, he might the more conveniently prosecute his designs against that city, which was

ever his chief object. Owing to the divided state of the Portuguese government at that juncture, the meffenger returned with an unfatisfactory answer, but a sense of their interest induced them afterwards to order a veffel laden with stores to proceed to the relief of Aru; where the Acheen fleet foon appeared, confifting of an hundred and fixty fail, of which fifteen were large veffels. In these were embarked seventeen thousand men, of whom twelve thousand were military, and among them four thousand foreigners. The whole was commanded by Heredin Mahomet, who had married the king's fifter, and was his governor of Baroos. Whilst these entered the river Panetican, the king of Aru was employed in fortifying himself on shore, with fix thousand of his subjects. For fix days the enemy battered the town from their veffels, and then landed with twelve large pieces of artillery. Having demolished the outer forts, they gave a general affault; but the befieged sustained it with fo much refolution, and exerted themselves so effectually, that they repulsed the affailants, and killed the leader, an Abyffinian, who had arrived from Judda but a month before, to confirm a league made by the Baffa of Cairo, on behalf of the Grand Signior, with the king of Acheen. But in the end the place was taken, and the brave king of Aru killed, owing to the treachery of one of his own captains, whom the Achenese had corrupted. The commander, from being governor: was made fultan of Baroos for this eminent service.

Inche Seence, the queen of the deceased monarch, having retired to 1540. the woods before the fiege, now infested the Achenese garrison with many irregular attacks, but at length, upon the fetting in of the rains. fhe was necessitated to quit the country, and embarking her people in fuch boats as she could procure, passed over to Malacca, in order to fue for aid to recover her husband's kingdom. Here she attended in vain for five months, and then departed, to implore of the king of Oojongtana (formerly of Bintang) that affistance which the Portuguese denied her. This prince had compaffion for her fituation, and in order to furnish a pretext for demanding the restitution of Aru, he took her to wife. After a letter had paffed between him and the king of Acheen;

in which the latter told him he could perceive he had written from the table of his nuptials, amidst drunken counsellors; he fitted out a fleet, under the command of the great Lacfemanna, which retook Aru, and put the garrison, which consisted of fourteen hundred men, to the sword. This was no fooner effected than a powerful fleet arrived from Acheen to fuccour the place, commanded by Heredin Mahomet, whom his mafter thought invincible. A desperate engagement took place in the river. The advantage was a long time doubtful, until Heredin fell by a cannon shot. His captains, disconcerted by this accident, endeavored to shelter the ships, by getting round a neighbouring point of land, but the violence of the current forced them out to fea, and entirely dispersed them, by which means all but a few fell into the hands of Lacfemanna; Fourteen vessels that escaped, carried the news of this defeat to the king of Acheen, who ordered that the heads of the captains should be struck off, and that the foldiers should ever afterwards be dressed in women's apparel. In the year 1547 he fitted out a fleet against Malacca, where a descent was made, but contented with some trifling plunder, the army re-embarked, and the veffels proceeded to the river of Parles on the Malayan coast. Hither they were followed by a Portuguese squadron, which attacked and defeated a division of the fleet, at the mouth of the river. This victory was rendered famous, not fo much by the valor of the combatants, as by a revelation which was made from heaven to the missionary Francisco Xavier, of the time and circumstances of it. and which he announced to the garrison, at a moment when the approach of a powerful invader from another quarter, had caused much alarm and apprehension among them.f

f Diogo do Couto.

furprize, and committed great flaughter, putting the king and all his family to death. The eldest son of the king of Acheen was placed in the government, who fell, as we shall presently see, at the siege of Malacca.

The western powers of India having formed a league for the purpose of extirpating the Portuguese, the king of Acheen was invited to accede to it, and in conformity with the engagements by which the respective parties were bound, he prepared to attack them in Malacca, and carried thither a numerous fleet, in which were fifteen thousand people of his own fubjects and four hundred Turks, with two hundred pieces of artillery of different fizes. In order to amuse the enemy, he gave out that his force was destined against Java, and sent a letter, accompanied with a prefent of a creefe, to the governor, professing strong sentiments of friendship. A person whom he turned on shore with marks of ignominy, being suspected for a spy, was taken up, and being put to the torture, confessed that he was employed by the Grand Signior and king of Acheen, to poison the principal officers of the place, and to set fire to their magazine. He was put to death, and his mutilated carcafe was fent off to the king. This was the fignal for hostilities. He immediately landed with all his men, and commenced a regular fiege. Sallies were made with various fuccess, and very unequal numbers. In one of these the chief of Aru, the king's eldest son, was killed. In another the Portuguese were defeated and lost many officers. A variety of ftratagems were employed to work upon the fears, and shake the fidelity of the inhabitants of the town. A general affault was given, in which, after vast efforts of courage, and imminent risk of destruction, the befieged remained victorious. The king feeing all his attempts fruitlefs, at length departed, having loft three thousand men before the walls, befide about five hundred who were faid to have died of their wounds on the paffage. The king of Oojong-tana who arrived with a fleet to the affiftance of the place, found the fea for a long distance covered

1567.

with dead bodies. This was esteemed one of the most desperate and honorable sieges the Portuguese experienced in India, their whole force confisting of but sisteen hundred men, of whom no more than two hundred were Europeans.h

In the following year a veffel from Acheen bound to Java, with em-₹568. baffadors on board to the queen of Japara, in whom the king wished to raise up a new enemy against the Portuguese, was met in the straits by a veffel from Malacca, who took her and put all the people to the fword. It appears to have been a maxim in these wars never to give quarter to an enemy, whether refilting or fubmitting. In 1560 a fingle z569. ship, commanded by Lopez Carrasco, passing near Acheen, fell in with a fleet coming out of that port, confifting of twenty large gallies, and an hundred and eighty other veffels, commanded by the king in person. and supposed to be defigned against Malacca. The situation of the Portuguese was desperate. They could not expect to escape, and therefore refolved to die like men. During three days they fustained a continual attack, when after having by incredible exertions, deftroyed forty of the enemy's veffels, and being themselves reduced to the state of a wreck. a fecond ship appeared in fight. The king perceiving this, retired into the harbour with his shattered forces.

It is difficult to determine which of the two is the more aftonishing; the vigorous stand made by such an handful of men as the whole strength of Malacca consisted of; or the prodigious resources and perseverence of the Achenese Monarch. In 1573, after forming an alliance with the queen of Japara, the object of which was the destruction of the European power, he appeared again before Malacca with ninety vessels, twenty sive of them large gallies, with seven thousand men, and great store of artillery. He began his operations by sending a party to set sire to the suburbs of the town, but a timely shower of rain prevented it's taking effect. He then resolved on a different mode of warfare, and

h Diogo do Couto. Faria y Soufa.

tried to starve the place to a furrender, by blocking up the harbour. and cutting off all supplies of provisions. The Portugeuse, to prevent the fatal confequences of this measure, collected those few vessels which they were mafters of, and a merchant ship of some force arriving opportunely, they put to fea, attacked the enemies fleet, killed the principal captain. and obtained a compleat victory. In the year following Malacca was 1574. invested by an armada from the queen of Japara, of three hundred fail, eighty of which were junks of four hundred tons burthen. After befieging the place for three months, till the very air became corrupted by their stay, the fleet retired with scarcely more than five thousand of fifteen that embarked on the expedition.

Scarce was the Javanese force departed, when the king of Acheen once 1575. more appeared with a fleet that is described as covering the straits. He ordered an attack upon three Portuguese frigates that were in the road protecting some provision vessels; which was executed with such a furious discharge of artillery, that they were presently destroyed with all their crews. This was a dreadful blow to Malacca, and lamented, as the historian relates, with tears of blood by the little garrison, who were not now above an hundred and fifty men, and of those a great part non effective. The king, elated with his fuccess, landed his troops, and laid fiege to the fort, which he battered at intervals during feventeen days. The fire of the Portuguese became very flack, and after some time totally ceased, as the governor judged it prudent to reserve his small stock of ammunition, for an effort at the last extremity. The king, alarmed at this filence, which he construed into a preparation for some dangerous flratagem, was feized with a panick, and fuddenly raifing the fiege, embarked with the utmost precipitation; unexpectedly relieving the garrison from the ruin that hung over them, and which seemed inevitable in the ordinary course of events. h god as listed solden after executive at the

In 1582 we find the king appearing again before Malacca with an 1582. hundred and fifty fail of veffels. After some skirmishes with the Portu-

h Diogo do Couto. Faria y Soufa,

guese ships, in which the success was nearly equal on both sides, the Achenese proceeded to attack Johor, the king of which was then in alliance with Malacca. Twelve ships followed them thither, and having burned some of their gallies deseated the rest, and obliged them to sly to Acheen.

About four years after this misfortune, the king prepared a fleet of no less than three hundred sail, and was ready to set out once more upon his favorite enterprize, when his general, named Moratiza, who had long since designed to usurp the crown, murdered him, his queen, and the principal nobility.

About this time the consequence of the kingdom of Acheen had arrived at a great height. Its friendship was courted by the most confiderable eastern potentates; no city in India possessed a more flourishing trade; the customs of the port being moderate, it was crowded with merchants from all parts, and though the Portuguese and their ships were continually plundered, yet those belonging to every native power, from Mecca in the west, to Japan in the east, appear to have enjoyed perfect fecurity in the business of their commerce. With respect to the government, the nobles, or orang cayos as they are called, formed a powerful counterpoise to the authority of the king. They were rich; had numerous followers, and cannon planted at the gates of their houfes; and thus feeling themselves independent, often gave a licentious range to their proud and impatient tempers. Although the generality of Portuguese historians have indirectly attributed the transactions of the last fifty or fixty years to a fingle reign, yet we have some authority, befide the evident probability of the matter, for faying that during that space of time, there were many revolutions in the court, brought about by the intrigues of the nobles, until at length the ancient royal line became extinct. 1

i Faria y Soufa. k Faria y Soufa. 1 Beaulieu.

The

The usurper mounted the throne, by the title of sultan Aladin,* at an advanced period of life. He was originally a sisherman, and afterwards ferved in the wars against Malacca, where he shewed so much courage, prudence, and skill in maritime affairs, that the late king made him at length the chief commander of his forces, and gave him one of his nearest kinswomen to wife. The monarch's only child, a daughter, was married to the king of Johor, by whom she had a son. The insant was sent to Acheen to be educated under his grandsather, whose heir he was designed to be. Upon the death of the king, Aladin at first took the protection of the child, but soon after dispatched him also, and then declared himself sovereign in the right of his wife. Having the royal force in his hands, he curbed the power of the rest of the nobles, who attempted to make resistance against this step, and put numbers of them

* This name which the hero of the Crusades rendered famous in the east, is common among the Malays, who pronounce it, Ladeen.

† The king of Acheen fent on this occasion, to Johor, a piece of ordnance, such as for greatness, length, and workmanship could hardly be matched in all Christendom. It was afterwards taken by the Portuguese, who shipt it for Europe, but the vessel was lost in her passage. Linschoten.

t Commodore Beaulieu relates the circumstances of this revolution in a very different manner. The nobles, he fays, upon the extinction of the royal line, fetting up each their respective pretenfions to the crown, were proceeding to decide the matter by force, when they were prevailed on by the chief prieft, to prevent bloodshed, and at the same time preserve their claims, by raising to the throne an old nobleman of much wisdom and experience, and who was descended from one of the first families of the kingdom, but had not affected any pretentions to the dignity. That after many refufals to quit his retired life, he was at length forced to acquiescence, on the condition of their regarding him as a father. But no fooner was he in possession of the sovereign power, than he shewed a different face, and the first step after his accession, was to invite all the nobles of the realm to an entertainment, where, as they were introduced one by one to an inner court of the palace, he had them murdered. This flory, allowing for the difference of fituation and manners, bears a firong refemblance to the election of Sixtus the fifth to the Papacy. The Commodore had great opportunity of information, and was a fenfible man, but he appears in this case to have been amused with a plausible tale by the grandson of this monarch, whom probably he had it from. John Davis, an intelligent English navigator, whose account I follow. was more likely to hear the truth; and he was at Acheen during Aladin's reign, whereas the Commodore did not arrive till twenty years after. Besides, a Dutch Admiral who was at Acheen about three years after Davis, confirms the report of Aladin's having been originally a fisherman. But both the Commodore and Davis place the event of his accession about five years earlier than the Spanish historian,

to death, raifing his own adherents, from the lower class of people, to the first dignities of the state. To ensure the suture submission of the nobility, he seized their cannon and arms, demolished their fortissed houses, and prohibited their rebuilding with any substantial materials. Of those among the people who presumed to express any disapprobation of his conduct, he made great slaughter, and was supposed to have caused not less than twenty thousand persons to be executed in the first year of his reign.

As the Portuguese writers make scarcely any mention of this king's actions, we have reason to conclude that he did not prove so formidable an enemy to Malacca as his predecessor had been; and it appears that embassadors from that city resided, at different periods, in his court. Some expeditions, however, he sitted out against it, in which a general of his, named Raja Maccota, had opportunities of signalizing his valour. He had long and frequent wars with the king of Johor.

1600.

Towards the close of the fixteenth century, the Hollanders began to navigate the Indian seas, and in the year 1600 some of their ships arrived at Acheen, where they had no cause to boast of the hospitality of their treatment. An attempt was made, and probably not without the orders, or connivance of the king, to cut off two of their vessels, and several of the crews were murdered; but after a desperate conslict, the affassins were overcome and driven into the water; "and it was some pleasure (says John Davis, who was the principal pilot of the ships) to see how the base Indians did sly, how they were killed, and how well they were drowned." This treacherous action was attributed to the instigation of the Portuguese. A second party of that nation, who endeavored to trade there a short time afterwards, met with little better usage, and were obliged to hasten out of the road, leaving a part of their merchandize on shore.*

1601.

m John Davis. n Queen Elizabeth's letter to the king of Acheen.

^{*} It is somewhat remarkable that the Hollanders, not only at Acheen but at Bantam, were about this time always called English by the natives, notwithstanding they endeavoured, or so pretended, to establish a just idea of the distinction between the two nations. See Collection of voyages which contributed to the establishment of the Netherlands East India Company.

The first English fleet that made it's appearance in this part of the world, and laid the foundation of a commerce which was in time to eclipse that of every other European state, visited Acheen in the year 1602. Lancaster, who commanded it, was received by the king with 1602. abundant ceremony and respect, which seem with these monarchs to have been usually proportioned to the number of vessels and apparent strength of their foreign guests. The queen of England's letter was conveyed to court with great pomp, and the general, after delivering a rich present, the most admired article of which was a fan of feathers, declared the purpose of his coming, was to establish peace and amity between his royal mistress, and her loving brother, the great and mighty king of Acheen. He was invited to a banquet prepared for his entertainment, in which the fervice was of gold, and the king's damfels, who were richly attired and adorned with bracelets and jewels, were ordered to divert him with dancing and music. Before he retired he was arrayed by the king in a magnificent habit of the country, and armed with two creefes. In the present sent as a return for the queen's, there was, among other matters, a valuable ruby fet in a ring. Two of the nobles, one of whom was the chief priest, were appointed to settle with Lancaster the terms of a commercial treaty, which was accordingly drawn up and executed, in an explicit and regular manner. The Portuguese embassador, or more properly the Spanish, as those kingdoms were now united, kept a watchful and jealous eye upon his proceedings; but by bribing the spies who furrounded him, he foiled them at their own arts, and acquired intelligence that enabled him to take a rich prize in the straits of Malacca, with which he returned to Acheen; and having loaded what pepper he could procure there, took his departure. On this occasion it was requested by Aladin, that he and his officers would favor him by finging one of the pfalms of David, which was performed with great folemnity°.

Aladin had two fons, the younger of whom he made king of Pedeer, and the elder he kept at Acheen in order to succeed him in the throne.

· Lancaster's Voyage.

In the year 1603, he resolved to divide the charge of government with his intended heir, as he found his extraordinary age began to render him unequal to the task, and accordingly invested him with royal dignity; but the effect which might have been foreseen quickly followed this meafure. The fon, who was already advanced in years, became impatient to enjoy more compleat power, and thinking his father had poffeffed the crown fufficiently long, he confined him in a prison, where his days were foon ended.4 He was then ninety five years of age,* and described to be a hale man, but extremely gross and fat. His constitution must have been uncommonly vigorous, and his mufcular strength is indicated by this ludicrous circumstance, that when he once condescended to embrace a Dutch admiral, contrary to the usual manners of his country, the pressure of his arms was so violent as to cause excessive pain to the person so honored. He was passionately addicted to women, gaming, and to drink, his favorite beverage being arrack. By the feverity of his punishments he kept his subjects in extreme awe of him; and the merchants who traded to his ports were obliged to fubmit to more exactions and oppressions than were felt under the government of his predecessors.

The new king proved himself, from indolence or want of capacity, unsit to reign. He was always surrounded by his women, who were not only his attendants but his guards, and carried arms for that purpose. His occupations were the bath and the chase, and the affairs of state were neglected; insomuch that murders, robberies, oppression, and an infinity of disorders took place in the kingdom, for want of a regular and strict administration of justice. A son of the daughter of Aladin had been a great savorite of his grandsather, at the time of whose seath

9 John Davis.

^{*} According to Beaulieu. Davis fays he was about an hundred; and the Dutch voyages mention that his great age prevented his ever appearing out of his palace.

F Dutch voyages. Beaulieus

he was twenty three years of age, and continued, with his mother, to reside at the court after that event. His uncle, the king of Acheen, having given him a rebuke on some occasion, he left his palace abruptly, and sled to the king of Pedeer, who received him with affection, and resused to send him back at the desire of the elder brother, or to offer any violence to a young prince whom their father loved. This was the occasion of an inveterate war, which cost the lives of many thousand people. The nephew commanded the forces of Pedeer, and for some time maintained the advantage, but these at length, seeing themselves much inserior in numbers to those of Acheen, resused to march, and the king was obliged to give him up, when he was conveyed to Acheen, and put in close confinement.

Not long afterwards a Portuguese squadron, under Martin Alfonso. going to the relief of Malacca, then befieged by the Dutch, anchored in Acheen road, with the resolution of taking revenge on the king, for receiving these their rivals into his ports, contrary to the stipulations of a treaty that had been entered into between them. The vicerov landed his men, who were opposed by a strong force on the part of the Achenese, but after a stout resistance they gained the first turf fort with two pieces of cannon, and commenced an attack upon the fecond, of mafonry. In this critical juncture, the young prince fent a meffage to his uncle, requesting he might be permitted to join the army and expose himself in the ranks; declaring himself more willing to die in battle against the Caffres (fo they always affected to call the Portuguefe*) than to languish like a flave in chains. The fears which operated upon the king's mind, induced him to confent to his release. The prince shewed so much bravery on this occasion, and conducted two or three attacks with fuch fuccess, that Alfonso was obliged to order a retreat, after wasting two days, and losing three hundred men in this

s Beaulieu.

t Faria y foufa.

fruitless

1606.

fruitless attempt. The reputation of the prince was raised by this affair to a high pitch amongst the people of Acheen. His mother, who was an active, ambitious woman, formed the defign of raifing him to the throne, and furnished him with large sums of money to be distributed in gratuities amongst the principal orang cayos. At the same time he endeavored to ingratiate himself by his manners, with all classes of people. To the rich he was courteous; to the poor he was affable; and he was the constant companion of those who were in the profession of arms. The king died fuddenly, and at the hour of his death the prince got access to the castle. He bribed the guards; made liberal promises to the officers; advanced a large fum of money to the governor; and fending for the chief prieft, obliged him by threats to crown him. In fine, he managed the revolution fo happily, that he was proclaimed king before night; to the great joy of the people, who conceived vast hopes from his liberality, courtefy, and valor. The king of Pedeer was speedily acquainted with the news of his brother's death, but not of the fubfequent transactions, and came the next day to take possession of his inheritance. As he approached the castle with a small retinue, he was feized by orders from the reigning prince, who, forgetting the favors he had received, kept him prisoner for a month, and then sending him into the country, under the pretence of a commodious retreat, had him murdered on the way. Those who put the crown on his head were not better requited; particularly the Maharaja, or governor of the castle. In a fhort time his disappointed subjects found, that instead of being humane, he was cruel; instead of being liberal, he displayed extreme avarice; and inftead of being affable, he manifested a temper austere and inexorable."

2607.

This king affumed the title of Sultan Peducka Siri, fovereign of Acheen, and of the countries of Aru, Delhi, Johor, Paham, Queda, and Pera, on the one fide, and Baroos, Passamman, Ticoo, Sileda, and Priaman, upon the other. Some of these places were conquered by

him, and others he inherited. He shewed much friendship to the Hollanders in the early part of his reign; and in the year 1613 gave per- 1613. mission to the English to settle a factory, granting them many indulgences, in confequence of a letter and present from king James the first. He bestowed on Captain Best, who was the bearer of them, the title of Orang cayo pootee, and entertained him with the fighting of elephants, buffaloes, rams, and tigers. In his answer to king James, which is couched in the most friendly terms, he styles himself king of all Sumatra, a name and idea, which, if they exist in the original,* he must have learned from his European connexions. He expressed a strong defire that the king of England should fend him one of his countrywomen to wife, and promifed to make her eldeft fon king of all the pepper countries, that fo the English might be supplied with that commodity by a monarch of their own. But notwithstanding his strong professions of attachment to us, and his natural connexion with the Hollanders, arifing from their joint enmity to the Portuguese, it was not many years before he began to oppress both nations, and use his endeavors to ruin their trade. He became jealous of their growing power, and particularly by reason of the intelligence which reached him, concerning the encroachments made by the latter in the island of Java.

The conquest of Aru seems never to have been thoroughly effected by the kings of Acheen. Peducka carried his arms thither, and boafted of having obtained fome victories. In 1613 he subdued Siak, in its neighbourhood, and in the same year ravaged the kingdom of Johor, and had the kings of these two places, who were brothers, brought captives to Acheen; but released them upon their consenting to become his tributaries. The old king of Johor; who had so often engaged the Portuguese, left feveral fons, the eldeft of whom succeeded him by the title of Eeang de Patooan, the second was made king of Siak, and the third, Raja Bon-600 by name, reigned jointly with the first. He it was who affisted the Hollanders in the first siege of Malacca, and corresponded with prince Maurice. The king of Acheen was married to their fifter, but this did

^{*} Translations of this letter and of that written to Queen Elizabeth are to be found in Purchas.

not prevent a long and cruel war between them. ** A Dutch factory at Johor was involved in the consequences of this war, and several of that nation were amongst the prisoners. Y

In 1615 the king of Acheen failed to the attack of Malacca in a fleet which he had been four years employed in preparing. w It confifted of above five hundred fail, of which an hundred were large gallies, greater than any at that time built in Europe, carrying each from fix to eight hundred men, with three large cannon and feveral fmaller pieces. x These gallies the orang cayos were obliged to furnish, repair, and man, at the peril of their lives. The foldiers ferved without pay, and carried three months provision at their own charge. In this great fleet there were computed to be fixty thousand men, whom the king commanded in person. His wives and household were taken to sea with him. Coming in fight of the Portuguese ships in the afternoon, they received many shot from them, but avoided returning any, as if from contempt. The next day they got ready for battle, and drew up in form of an half moon. A desperate engagement took place, and lasted without intermission till midnight, during which the Portuguese admiral was three times boarded. and repeatedly on fire. Many veffels on both fides were also in flames. and afforded light to continue the combat. At length the Achenese gave way, after losing fifty fail of different fizes, and twenty thousand men. They retired to Bencalis, on the eastern coast of Sumatra, and shortly afterwards failed for Acheen, the Portuguese not daring to purfue their victory, both on account of the damage they had fustained. and their apprehension of the Hollanders, who were expected at Malacca. The king proposed that the prisoners taken, should be mutually given up, which was agreed to, and was the first instance of that act of humanity and civilization between the two powers. 2 plies of a contract of the

a Collection of Dutch voyages, sking of Sight and was made king of Sight would be a collection of Dutch voyages.

The title of Eeang de Patooan is common amongst the Malays, and is the same with that which in a former note p. 276, is corruptly spelt Jeanderpatoon. The chief of Borneo-proper is always so styled.

v C. Best. W Faria y Sousa. Beaulieu. Faria y Sousa. Y Beaulieu. Z Faria y Sousa.

Three

Three years afterwards the king made a conquest of the city of Queda, on the Malayan coast; and also of a place called Delhy on Sumatra. This last had been strongly fortified by the assistance of the Portuguese, and gave an opportunity of displaying much skill in the attack. Trenches were regularly opened before it, and a siege carried on for six weeks, ere it fell.² In the same year the king of Jorcan* fled for resuge to Malacca, with eighty sail of boats, having been expelled his dominions by the king of Acheen. The Portuguese were not in a condition to afford him relief, being themselves surrounded with enemies, and fearful of an attack from the Achenese more especially; but the king was then making preparations against an invasion he heard was meditated by the viceroy of Goa. Reciprocal apprehensions kept each party on the defensive.

The French being defirous of participating in the commerce of Acheen; which all the European nations had formed great ideas of, and all found themselves disappointed in; sent out a fleet commanded by Beaulieu, which arrived in 1621. He brought magnificent presents to the king, but which did not content his insatiable avarice, and he employed a variety of mean arts to draw from him further gifts. Beaulieu met also with many difficulties, and was forced to submit to much extortion, in his endeavors to procure a loading of pepper, of which Acheen itself, as has been observed, produced but little. The king informed him that he had some time since ordered all the plants to be destroyed, not only because the cultivation of them proved an injury to more useful agriculture, but also least their produce might tempt the Europeans to serve him, as they had served the kings of Jacatra and Bantam. From this apprehension, he had lately been induced to expel

1618

a Beaulieu.

^{*} I am uncertain what place is defigned by this name: perhaps a country on the banks of the river Racan or Ircan. The time of the event would lead us to conclude that the king of Jorcan was the fame who defended Delhy.

b Faria y Soufa.

where the principal quantity of pepper was procured, and of which places he changed the governor every third year, to prevent any connexions dangerous to his authority, from being formed. He had likewise driven the Dutch from a factory they were attempting to settle at Padang; which place appears to be the most remote that ever the Achenese attempted to exercise dominion over, on the western coast of the island.

\$628.

Still retaining a strong defire to possess himself of Malacca, so many years the grand object of Achenese ambition, he imprisoned the embasfador then at his court, and made extraordinary preparations for the fiege, which he defigned to undertake in person.* Lacsemanna his general (the fecond great man of that name or title, and who had effected all the king's late conquests) attempted to oppose this resolution; but the Maharaja, willing to flatter his mafter's propenfity, undertook to put him in possession of the city, and had the command of the fleet given to him, as the other had of the land forces. The king fet out on the expedition with a fleet of two hundred and fifty fail, (forty feven of them not less than an hundred feet in the keel) in which were twenty thousand men well appointed, and a great train of artillery. After being fome time on board, with his family and retinue as usual, he determined, on account of an ill omen that was observed, to return to the shore. The generals, proceeding without him, soon arrived before Malacca. Having landed their men, they made a judicious disposition, and began the attack with much courage and military skill. The Portuguese were obliged to abandon several of their posts, one of which, after a defence of fifty days, was levelled with the ground, and from it's ruins ftrong works were raifed by Lacfemanna. Maharaja had feized another post advantageously situated. From their several camps they had lines

c Beaulieu.

^{*} Faria y Soufa mentions an engagement in 1626, in which the king loft thirty four gallies, three thousand men, and eight hundred pieces of cannon.

of communication, and the boats on the river were stationed in such a manner, that the place was compleatly invested. Matters were in this posture, when a force of two thousand men came to the affistance of the befieged, from the king of Paham, and likewise five fail of Portuguese veffels from the coast of Coromandel; but all was insufficient to remove fo powerful an enemy, although by that time they had loft four thousand of their troops in the different attacks and skirmishes. In the latter end of the year a fleet of thirty fail of ships, large and finall, under the command of Nunno Alvarez Botello, having on board nine hundred European foldiers, appeared off Malacca, and blocked up the fleet of Acheen in a river about three miles from the town. This entirely altered the complexion of affairs. The befiegers retired from their advanced works, and hastened to the defence of their gallies: erecting batteries by the fide of the river. Maharaja being fummoned to furrender, returned a civil, but refolute answer. In the night, endeavoring to make his escape with the smaller vessels, through the midst of the Portuguese, he was repulsed and wounded. Next day the whole force of the Achenese dropt down the stream, with a design to fight their way, but after an engagement of two hours, their principal galley, named the "Terror of the world" was boarded and taken, after lofing five hundred men of feven which she carried. Many other vessels were afterwards captured or funk. Lacfemanna hung out a white flag, and fent to treat with Nonno, but some difficulty arising about the terms. the engagement was renewed with great warmth. News was brought to the Portuguese that Maharaja was killed, and that the king of Paham was approaching with an hundred fail of veffels to reinforce them. Still the Achenese kept up a dreadful fire, which seemed to render the final fuccess doubtful; but at length they sent proposals, defiring only to be allowed three gallies of all their fleet, to carry away four thousand men who remained of twenty that came before the town. It was answered that they must furrender at discretion; which Lacsemanna hesitating to do, a furious affault took place both by water and land, upon the gallies and works of the Achenese, which were all totally destroyed or captured, not a ship, and scarcely a man escaping. Lacsemanna in the 4 Z last

1635.

1640.

364I.

last extremity fled to the woods, but was seized ere long by the king of Paham's scouts. Being brought before the governor, he said to him, with an undaunted countenance, "Behold here Lacsemanna, the first time overcome!" He was treated with respect, but kept a prisoner, and sent, on his own famous ship, to Goa, in order to be from thence conveyed to Portugal: but death deprived his enemies of that distinguished ornament of their triumph.

This fignal defeat proved so important a blow to the power of Acheen, that we read of no further attempts to renew the war, until the year 1635, when the king, encouraged by the feuds which at this time prevailed in Malacca, again violated the law of nations, to him little known, by imprisoning their embassador, and caused all the Portuguese about his court to be murdered. No military operations, however, immediately took place, in confequence of this barbarous proceeding. In the year 1640, the Dutch with twelve men of war, and the king of Acheen with twenty five gallies, appeared before that harraffed and devoted city: which at length, in the following year, was wrested from the hands of the Portuguese, who had so long, through such difficulties, maintained possession of it. This year was also marked by the death of Sultan Peducka Siri, at the age of fixty, after a reign of thirty five years. f Thus he lived to fee his hereditary foe subdued; and as if the opposition of the Portuguese power, which first occasioned the rise of that of Acheen, was also necessary to its existence, the splendor and consequence of the kingdom from that period rapidly declined.

The prodigious wealth and resources of the monarchy during his reign, are best evinced by the expeditions he was enabled to fit out; but being equally covetous as ambitious, he contrived to make the expences fall upon his subjects, and at the same time filled his treasury with gold, by oppressing the merchants, and plundering the neighbouring states. An intelligent person who was for some time at his court, and had opportu-

d Faria y Soufa. e Here Faria de Soufan's history of Portuguese Asia concluded.

f Vies des Governeurs Hollandois.

nities of information on the subject, uses this strong expression-that he was infinitely rich. He constantly employed in his castle three hundred goldsmiths. This would seem an exaggeration, but that it is well known the Malay princes have them always about them in great numbers, at this day, working in the manufacture of fillagree, for which the country is fo famous. His naval strength has been already sufficiently described. He was possessed of two thousand brass guns, and fmall arms in proportion. His trained elephants amounted to many hundreds. His armies were probably raifed only upon the occasion which called for their acting, and that in a mode fimilar to what was eftablished under the feudal system in Europe. The valley of Acheen alone was faid to be able to furnish forty thousand men upon an emergency.f A certain number of warriors, however, were always kept on foot, for the protection of the king and his capital. Of these the superior class were called colooballang, and the inferior, amboraja, who were entirely devoted to his fervice, and refembled the janizaries of Constan tinople.* Two hundred horsemen nightly patrolled the grounds about the castle, the inner courts and apartments of which were guarded by three thousand women. The king's cunuchs amounted to five hundred.

The disposition of this monarch was cruel and sanguinary. A multitude of instances are recorded of the horrible barbarity of his punishments, and for the most trivial offences. He imprisoned his own mother, and put her to the torture, suspecting her to have been engaged in a conspiracy against him, with some of the principle nobles, whom he caused to be executed. He murdered his nephew, the king of Johor's son, whose favor with his mother he was jealous of. He also put to death a son of the king of Bantam, and another of the king of Paham,

^{*} The colooballangs now appear as officers of state, and are few in number; but in the old wars we read of seven hundred falling in one action.

who were both his near relations. None of the royal family furvived in 1622 but his own fon, a youth of eighteen, who had been thrice banished the court, and was thought to owe his continuance in life, only to his furpaffing his father, if possible, in cruelty, and being hated by all ranks of people. He was at one time made king of Pedeer, but recalled on account of his excesses, put to strange tortures by his father and confined in prison.h He did not outlive the king. The whole territory of Acheen was almost depopulated by wars, executions, and oppression. He endeavored to repeople the country by his conquests. Having ravaged the kingdoms of Johor, Paham, Queda, Pera, and Delhy, he transported the inhabitants from those places to Acheen, to the number of twenty two thousand persons. But this barbarous policy did not produce the effect he hoped; for the unhappy people being brought naked to his dominions, and allowed not any kind of maintenance on their arrival, died of hunger in the streets,i In the planning his military enterprizes, he was generally guided by the diffrestes of his neighbours, whom he ever lay in wait to make a prey of; and his preparatory measures were taken with such secrecy, that the execution alone unravelled them. Infidious political craft, and wanton delight in blood. united in him to complete the character of a tyrant.

Leaving no male heirs he was peaceably succeeded in the government by his queen; and this presents a new era in the history of the kingdom, as the succession continued for many years in the semale line. The nobles sinding their power less restrained, and their consequence more felt, under an administration of this kind, than when ruled by kings, supported these pageants whom they governed as they thought fit, and thereby virtually changed the constitution into an aristocracy. The bufiness of the state was managed by twelve orang cayos, of whom the

h Beaulieu. i Beaulieu. Collection of Dutch voyages. k Vies des Governeurs.

^{*} It has been a common error, repeated in many books of Geography, to suppose that queen Elizabeth corresponded with a queen, and not a king, of Acheen. But the female reigns did not commence till forty years after Elizabeth's death.

Maharaja, or governor of the kingdom, as it became usual from that time to call him, was considered as the chief. It does not appear that the queen had the power of appointing or removing any of these great officers. No applications were made to the throne, but in their presence, nor any public resolution taken, but as they determined in council.¹

In proportion as the political importance of the kingdom declined. it's history becomes obscure. There are no accounts to be met with of the transactions of this reign, and it is probable that Acheen took no active part in the affairs of the neighbouring powers, but fuffered the Dutch to remain in quiet possession of Malacca. Even the period of it's duration is not marked. In 1688 a queen of Acheen died, but as fhe is described by the English gentlemen who went there on an embassy from Madras in 1684, to be then about forty years of age, she must have been a succeffor, and perhaps not the immediate one, of Peducka's widow. These persons declare their suspicions, which were suggested to them by a doubt prevailing amongst the inhabitants, that this sovereign was not a real queen, but an eunuch dreffed up in female apparel, and imposed on the public by the artifices of the orang cayos." But as fuch a cheat though managed with every femblance of reality; which they observe was the case; could not be carried on for any number of years without detection, and as the fame idea does not appear to have been entertained at any other period, it is probable that they were mistaken in their furmife. Her person they describe to have been large, and her voice furprizingly firong, but not manly.*

The

n India Company's records.

^{*} The following curious passage is extracted from the journal of these gentlemen's proceedings.

"We went to give our attendance at the palace this day as customary. Being arrived at the place of audience with the orang cayos, the queen was pleased to order us to come nearer, when her majesty was very inquisitive into the use of our wearing Perriwigs, and what was the convenience of them; to all which we returned satisfactory answers. After this, her majesty desired

The purport of the embaffy was to obtain liberty to erect a fortification in her territory, which she peremptorily refused, being contrary to the established rules of the kingdom; adding, that if the governor of Madras would fill her palace with gold, she could not permit him to build with brick, either fort or house. To have a factory of timber and plank, was the utmost indulgence that could be allowed; and on that footing, the return of the English, who had not traded there for many years, should be welcomed with great friendship. The queen herfelf, the orang cayos represented, was not allowed to fortify, least some foreign power might avail themselves of it, to enslave the country. In the course of these negotiations it was mentioned, that the agriculture of Acheen had fuffered confiderably of late years, by reason of a general license given to all the inhabitants to fearch for gold, in the mountains and rivers which afforded that article; whereas the bufiness had formerly been restricted to certain authorized persons, and the rest obliged to till the ground. It likewise appeared, that through the weakness of it's government, and the encroachments of the Dutch, the extent of it's ancient dominion was much reduced, and no absolute jurisdiction was claimed more distant than Pedeer. The court feared to give a public fanction for the fettlement of the English on any part of the fouthern coaft, left it should embroil them with the other European power. *

The

of Mr. Ord, if it were no affront to him, that he would take off his perriwig, that the might fee how he appeared without it; which accordingly to her majefty's request he did. She then told us she had heard of our business, and would give her answer by the orang cayos; and so we retired." I venture, with submission, to observe, that this anecdote seems to put the question of the fex beyond controversy.

1684.

o India Company's records.

^{*} The defign of fettling a factory at this period, in the dominions of Acheen, was occasioned by the recent loss of our establishment at Bantam, which had been originally fixed by Sir James Lancaster in 1603. The circumstances of this event were as follows. The old Sultan had thought proper to share the regal power with his son, in the year 1677, and this measure was attended with the obvious effect, of a jealousy between the parent and child, which soon broke forth into open hostilities. The policy of the Dutch led them to take an active part in favor of the young sultan, who had inclined most to their interests, and now solicited their aid. The English, on the other hand, discouraged what appeared to them an unnatural rebellion, but with-

The people of Acheen being now accustomed and reconciled to female rule, which they found more lenient than that of their kings, acquiesced

out interfering, as they faid, in any other character than that of mediators, or affording military affiliance to either party; and which their extreme weakness, rather than their affertions, renders probable. On the twenty-eighth of March 1682, the Dutch landed a confiderable force from Batavia, and foon terminated the war. They placed the young fultan on the throne, delivering the father into his custody, and obtained from him in return for these favors, an exclusive privilege of trade in his territories; which was evidently the sole object they had in view. On the first day of April, possession was taken of the English factory, by a party of Dutch and country soldiers, and on the twelfth, the Agent and Council were obliged to embark, with their property, on vessels provided for the purpose, which carried them to Batavia. From thence they proceeded to Surat, on the twenty second of August in the following year.

In order to retain a share in the Pepper trade, the English turned their thoughts towards Acheen, and a deputation, confifting of two gentlemen, of the names of Ord and Cawley, was fent this ther in 1684; the fuccess of which is above related. It happened that at this time, certain Rajas or chiefs of the country of Priaman, and other places on the West coast of Sumatra were at Acheen alfo, to folicit aid of that court against the Dutch, who had made war upon, and otherwise molested them. These immediately applied to Mr. Ord, expressing a strong defire that the English should settle in their respective districts, offering ground for a fort, and the exclusive purchase of their Pepper. They consented to embark for Madras, where an agreement was formed with them by the governor, in the beginning of the year 1685, on the terms they had proposed. In consequence of this, an expedition was fitted out, with the defign of establishing a settlement at Priaman; but a day or two before the ships failed, an invitation, to the like purport, was received from the chiefs of Bencouloo (fince corruptly called Bencoolen); and as it was known that a confiderable proportion of the Pepper that used to be exported from Bantam, had been collected from the neighbourhood of Bencoolen, (at a place called Silebar), it was judged adviseable that Mr. Ord, who was the person entrusted with the management of this business, should first proceed thither; particularly as at that feafon of the year it was the windermost port. He arrived there on the twenty-fifth day of June 1685, and after taking possession of the country assigned to the English Company, and leaving Mr. Bloome in charge of the place, he failed for the purpose of establishing the other fettlements. He stopt first at Indrapour, where he found three Englishmen who were left of a small factory, that had been some time before settled there, by a man of the name of Du Jardin. Here he learned that the Dutch, having obtained a knowledge of the original intention of our fixing at Priaman, had anticipated us therein, and fent a party to occupy the fituation. In the mean time it was understood in Europe that this place was the chief of our establishments on the coast, and ships were accordingly configned thither. The same was supposed at Madras, and troops and stores were sent to reinforce it, which were afterwards landed at Indrapour. A fettlement was then formed at Manduta, and another attempted at Bantang Capas, in 1686; but here the Dutch, affilted by a party amongst the natives, affaulted and drove out our people. Every possible opposition, as it was natural to expect, was given by these our rivals, to the success of our factories. They fixed themselves in the neighbourhood quiesced in general in the continuance of the established mode of government, and a queen accordingly succeeded in 1688. But this did not

bourhood of them, and endeavoured to obstruct the country people from carrying pepper to them, or fupplying them with provisions either by fea or land. Our interests however in the end prevailed, and Bencoolen in particular, to which the other places were rendered fubordinate in 1686, began to acquire fome degree of vigor and respectability. In 1689 encouragement was given to Chinese colonists to settle there, whose number have been continually encreasing from that time. In 1691 the Dutch felt the loss of their influence at Selebar and other of the fouthern countries, where they attempted to exert authority in the name of the fultan of Bantam; and the produce of these places was delivered to the English. This revolution proceeded from the works with which about this time our factory was strengthened. In 1695 a settlement was made at Triamong, and two years after, at Cattown and Sablat. The first, in the year 1700, was removed to Bantal. Various applications were made by the natives in different parts of the island, for the establishment of factories, particularly from Ayer Bongey to the northward, Palembang on the eastern fide, and the people from the countries fouth of Tallo, near Manna. A person was sent to survey these last, as far as Poolo Pesang and Croee, in 1715. In consequence of the inconvenience attending the shipping off goods from Bencoolen river, which is often impracticable from the furfs, a warehouse was built, in 1701, at a place they called the cove; which gave the first idea of removing the fettlement to the point of land which forms the bay of Bencoolen. The fickliness of the old fituation was thought to render this an expedient step; and accordingly about 1714, it was in great measure relinquished and the foundations of Fort Marlborough were laid on a fpot two or three miles distant. Being a high plain it was judged to possess confiderable advantages; many of which, however, are counterbalanced by its want of the vicinity of a river; fo necessary for the ready and plentiful supply of provisions. Some progress had been made in the erection of this fort, when an accident happened, that had nearly overfet the Company's views. The country people incenfed at ill treatment received from the Europeans, who were then but little versed in the knowledge of their dispositions, or the art of managing them by conciliating methods, role in a body in the year 1719, and forced the garrison, whose ignorant fears rendered them precipitate, to feek refuge on board their ships. They began now to feel. alarms leaft the Dutch should take advantage of the absence of the English, and soon permitted. some persons from the northern factories, to resettle the place; and supplies ariving from Madras, things returned to their former courfe, and the fort was compleated. The Company's affairs on this coast remained in tranquility for a number of years. The important settlement of Natal was established in 1752, and that of Tappanooly a short time afterwards; which involved the English in fresh disputes with the Dutch, who set up a claim to the country in which they are fituated. In the year 1760 the French, under Comte d'Effaign, destroyed all the English settlements on the coast of Sumatra; but they were soon re-established, and our possession fecured by the treaty of Paris in 1763. Fort Marlborough, which had been hitherto a peculiar subordinate of Fort St. George, was now formed into an independant Prefidency, and was furnished with a charter for creeting a Mayor's court, but which has never been enforced. In 1781, a detachment of Military from thence, embarked upon five East India ships, took possession of Padang and

all

not take place without a strong opposition from a faction amongst the orang cayos who wanted to fet up a king, and a civil war actually commenced. The two parties drew up on contrary fides of the river, and for two or three nights continued to fire at each other, but in the day time followed their ordinary occupations. These opportunities of intercourse made them sensible of their mutual folly. They agreed to throw afide their arms; and the crown remained in possession of the new elected queen.P It was faid to have been effeemed effential, that she should be a maiden, advanced in years, and connected by blood with the ancient royal line. In this reign, an English factory, which had been long difcontinued, was re-established at Acheen. In the interval, however, some private traders of this nation, had always refided on the spot. These usually endeavored to perfuade the state, that they represented the India Company, and fometimes acquired great influence, which they employed in a manner not only detrimental to that body, but to the interests of the merchants of India in general, by monopolizing the trade of the port, throwing impediments in the way of all shipping not configned to their management, and embezzling the cargoes of fuch as were.* An afylum was also afforded, beyond the reach of law, for all persons whose crimes or debts induced them to fly from the feveral European fettlements. These considerations chiefly, made the Company resolve to asfert their ancient privileges in that kingdom, and a deputation was fent

all the other Dutch factories, in confequence of the war with that nation. In 1782 the powder magazine of Fort Marlborough, in which were four hundred barrels of powder, was fired by lightning, and blew up with an explosion that, but for some fortunate circumstances, had annihilated the settlement and inhabitants. Providentially it only destroyed their stores, with the loss of a few lives. Subsequent events are yet in the womb of time. The history of the trade of a country, which is an entire monopoly, can neither be interesting nor useful. Suffice it then to say, that the quantity of Pepper produced in all the Company's districts on Sumatra, is, communibus annis, twelve hundred tons; of which the greater part comes to Europe, and the remainder is sent to China.

P Dampier's voyages.

^{*} The most distinguished of these independent factors, was one of the name of Francis Delton, who went out supercargoe of a ship to Siam, from whence he made several voyages to China, and at length settled at Acheen in 1688. The Company's establishment in 1695 came to nothing, whereas Delton's trade still slourished in 1704, when Lockyer was there.

from the prefidency of Madras in the year 1695, for that purpose, with letters addressed to her illustrious majesty the queen of Acheen, desiring permission to settle, on the terms her predecessors had granted to them: which was readily complied with, and a factory, but on a very limited scale, was established accordingly. At this time the Achenese were alarmed by the arrival of six sail of Dutch ships of force, with a number of troops on board, in their road; not having been visited by any of that nation for sisteen years: but they departed without offering any molestation.

1700.

3702.

The queen died in the year 1700, and with her the female monarchy expired. A priest found means, by his intrigues, to acquire the fovereignty. He attempted to impose some duties on the merchandize imported by the English, who had long been indulged with an exemption from all charges, except the complimentary presents on their arrival. This innovation the masters of ships then in the port determined to oppose, and in a very unwarrantable manner proceeded to immediate hostilities; firing upon the villages situated near the mouth of the river, and cutting off from the city all fupplies of provision by sea. The inhabitants feeling feverely the effects of this proceeding, grew clamorous against the government, which was soon obliged to restore to these insolent traders the privileges contended for. Advantage was taken of the public discontents to raise an insurrection in favor of the late queen's nephew," who fucceeding in his views, was in possession of the throne in 1704.5 And here the clue of our history, which has not been traced without confiderable difficulty, breaks off; and we are totally in the dark with respect to the transactions of the subsequent reigns. It is, however, brought down to a modern date, within the compass of authentic tradition; and I do not despair of being enabled hereafter to continue the account, unimportant though it be, to the days of the prince now upon the throne; whose reign has proved long, and attended with many reverses of fortune, which more than once have obliged him to fly from his kingdom.

Conclusion.

AVING thus brought to a close, the digest of such materials for an Account of the island of Sumatra, as I had been induced, from curiosity and love of science, to collect together during my residence there, and have had opportunity of acquiring since my return; and having endeavored to render my labors as sitting as my talents would allow, to meet the eye of the public, I now submit them chearfully, but not considently, to their inspection. I am sensible of the awsulness of the tribunal before which I am going to appear; but I also know the indulgence it is ever ready to shew, in a particular manner, to those whose writings tend to establish facts, rather than systems, and humbly to describe things as they exist, rather than to display the powers of a creative imagination.

To those, who may object that my description of the Island is in some respects incomplete, and in many points, unscientific, I am ready to avow it's manifest deficiencies, which I feel the strongest conviction of. I can only state in justification, that I was encouraged by persons of the first consideration in the world of science, and in some measure against my own feelings, to prepare for publication whatever materials I did possess for the Natural history of the country; as laying thereby a foundation stone, in a new building, upon which others hereafter might raife a more perfect superstructure. Many will doubtless observe, that the detail of manners and customs of an uncivilized people, descends often to circumstances fo trivial, as neither to interest nor to amuse a reader who has been accustomed to peruse volumes that treat of more important topics. To these I reply, that every man is inclined to suppose his own favorite object of pursuit, to be the most generally interesting; but candour should induce them to reflect, that what to them appear infignificant minutiæ, by others may be regarded as worthy matter of philosophical curiofity. Such details, in fact often prove the most acceptable parts of a work, from their greater chance of originality. All the races of man-

kind

kind bear to each other fo strong a resemblance, in the general outline and complexion of their fentiments and actions, and more especially of those which are usually termed important, that to exhibit such alone would mark no diffinction. The most prominent features in the delineation of any subject, are not found the most characteristic. The fpirit of ambition in men who aim at fovereign power, or of political jealoufy in those who already possess it, are observed to have produced the fame effects, in all countries, and in all ages; and confequently afford no criterion of the genius and manners of a particular people. This must be fought for rather in the less obvious occurrences of private. and domestic life; and will better appear in the focial customs of an obfcure village, than in the splendid ceremonies and arbitrary institutions of a powerful court. The former are the fettled refult of long prevalent ideas and habitual prejudices; the latter have their origin and temporary existence, in the caprice of individuals, who, if ignorant, headstrong and flagitious, make the most respected customs of their people, the sport of a momentary passion; or if wise and benevolently inclined, borrow their maxims of government and civil regulations, from the most enlightened amongst other nations, and thus, whilst they improve the condition of their subjects, destroy the peculiarity and genumeness of their character.

I would by no means be understood to contend that the history of fuch transactions is without its propriety and use. Man must be exhibited in every point of view; and in every light we behold it, the subject will be interesting. But I would suggest, that when he is found in his least sophisticated state, even though that should be in the rudest scene of uncultivated nature, the picture of his manners does not then claim an inferior degree of attention.

I have vainly wished that my performance could be rendered acceptable to all descriptions of readers; but as that is chimerical, I shall esteem myself happy if I meet the approbation, or even the indulgence, of the liberal, whom I would perfuade myself are not the sew. Genuineness, and a rigid adherence to truth, so far as it has been possible for a short-

a short-sighted mortal to distinguish between that and error, are what I presume chiefly to arrogate to myself, and on these I rest my claim to public favor. If any more experienced and better informed traveller, will point out to me where I have been deceived, in those matters to which I had an opportunity of being an eye witness, or misled, where I was obliged to depend upon the testimony of others, I shall be more forward to correct my mistakes, than I am now, unintentionally, to obtrude them on the world.
