Abstract

The edge geodesic cover problem of a graph G is to find a smallest number of geodesics that cover the edge set of G . The edge k -general position problem is introduced as the problem to find a largest set S of edges of G such that at most $k - 1$ edges of S lie on a common geodesic. We show that these are dual min-max problems and connect them to an edge geodesic partition problem. Using these connections, exact values of the edge k -general position number is determined for different values of k and for various networks including torus networks, hypercubes, and Benes networks.

Keywords: General position set, edge geodesic cover problem, edge k -general position problem, torus network, hypercube, Benes network.

Povzetek

Problem povezavnega geodetskega pokritja grafa G je: najti najmanjše število geodetik, ki pokrivajo povezavno množico grafa G . Povezavi k -splošni položajni problem vpeljemo kot problem najti največjo množico S povezav grafa G z lastnostjo, da največ $k - 1$ njenih povezav leži na skupni geodetki. Pokažemo, da sta to dualna ekstremalna problema iskanja minimuma oz. maksimuma, in ju povežemo s povezavnim partičijskim problemom. Na podlagi te povezave med problemoma določimo natančne vrednosti povezavnega k -splošnega položajnega števila za različne vrednosti k in za različne mreže, vključno s torusnimi mrežami, hiperkockami in Benesovimi mrežami.

Ključne besede: Splošna položajna množica, povezavni geodetski problem pokritja, povezavni k -splošni položajni problem, torusna mreža, hiperkocka, Benesova mreža.
