št./No 14

MORSKO RIBIŠTVO, SLOVENIJA, FEBRUAR 2004

MARINE FISHING, SLOVENIA, FEBRUARY 2004

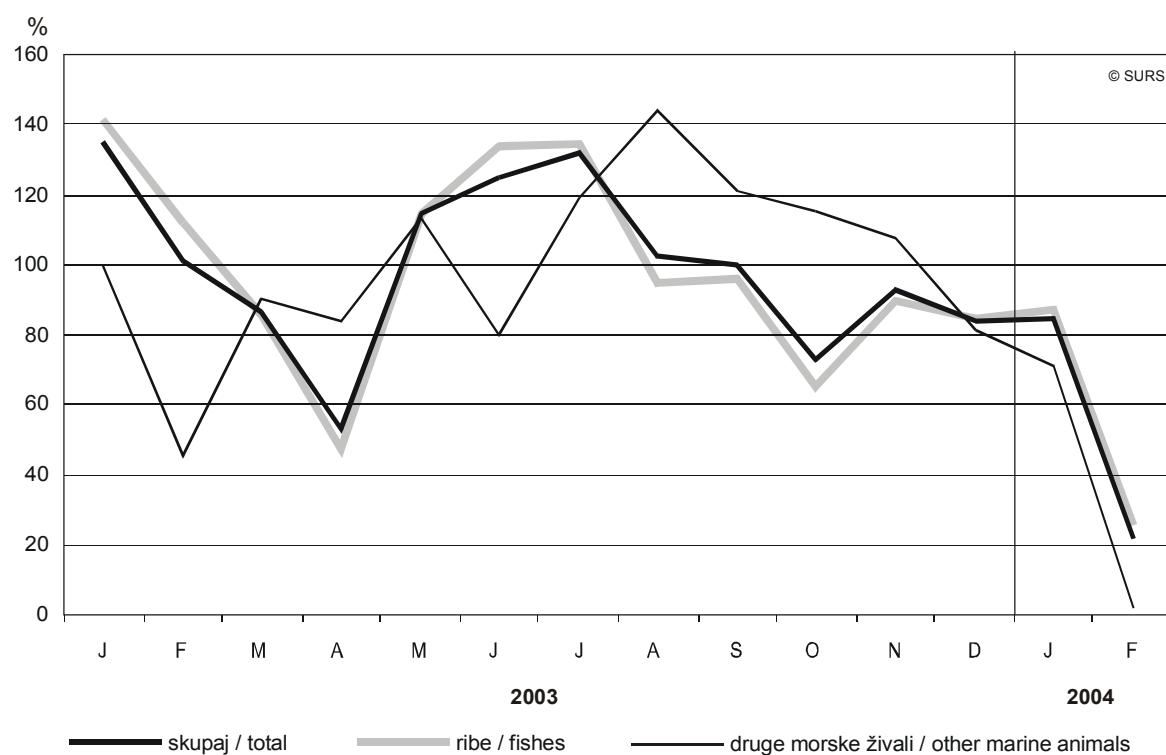

ZAČASNI PODATKI
PROVISIONAL DATA

- ▶ V februarju 2004 so ribiči, ribogojci in školjkarji ulovili in vzredili le 23 ton morskih živali. Za primerjavo: leta 1992 je bila tolikšna masa njihovega dnevnega ulova.
- ▶ Februarski ulov je tehtal le 11 ton rib, rakov in mehkužcev. V primerjavi s preteklim mesecem je bil manjši za 81,2 %, v primerjavi s februarjem 2003 pa za 88,5 %. Slab ulov je bil posledica pojava ogromnega števila morskih meduz; ribiči ga primerjajo z naravnou katastrofo na kopnem.
- ▶ Ribogojci so v februarju dostavili na trg 12 ton vrzejenih brancinov in orad. Zaradi onesnažene morske vode in visokih stroškov za prečiščevanje vzrejenih školjk pa je promet s školjkami začasno ustavljen.
- ▶ V prvih dveh mesecih 2004 je bila masa ulovljenih in vzrejenih morskih živali manjša za 54,8 % kot v enakem obdobju lanskega leta.

- ▶ In February 2004 fishermen, fish farmers and shell farmers caught and bred only 23 tons of marine animals. For illustration only: in 1992 that had been the mass of their daily catch.
- ▶ The total mass of caught marine animals in February was only 11 tons of fishes, crustaceans and molluscs. Compared to the previous month it decreased by 81.2%, while in comparison with February 2003 it was down by 88.5%. The low catch is the result of the invasion of marine jellyfish, which the fishermen claim it could be compared to a natural disaster in inland areas.
- ▶ In February fish farmers placed on the market 12 tons of European seabass and gilthead seabream. Because of polluted marine water and high expenses of cleaning bred shells, trade with bred shells is for the time being stopped.
- ▶ In the first two months of 2004 the total mass of caught and bred marine animals is 54.8% lower than in the same period of 2003.

METODOLOŠKA POJASNILA

Namen statističnega raziskovanja

Na podlagi zbranih podatkov prikazujemo mesečno maso ulova in vzreje morskih živali. V raziskovanju je zajetih 66 vrst plavih in belih rib in približno 10 vrst glavonožcev, rakov, školjk in polžev, ki jih ribiči lovijo v slovenskih ali mednarodnih vodah, in 5 vrste rib in školjk, ki jih ribogojci in školjkarji gojijo v urejenih gojitvenih objektih.

Enota opazovanja

so podjetja in družbe, ki se ukvarjajo z ulovom ali vzrejo morskih rib in školjk, in registrirani zasebni ribiči, ki jim je ribolov glavna ali dopolnilna dejavnost. Če več samostojnih ribičev lovi skupaj uporabljajoč isto ribiško plovilo (ista plovila), jih štejemo kot eno opazovano enoto.

Viri in zajetje podatkov

Podatek o ulovu in vzreji morskih rib, glavonožcev, rakov in školjk zbiramo z mesečnimi poročili o morskem ribolovu, ki jih izpolnjujejo podjetja, družbe in zasebni ribiči, ki so registrirani za opravljanje gospodarskih dejavnosti v ribištvu.

Definicije

Morsko ribištvo je gospodarska dejavnost, ki se ukvarja z lovљenjem morskih živali.

Marikultura je gospodarska dejavnost, ki se ukvarja z vzrejo morskih živali.

Z ulovom morskih živali je prikazana količina ulovljenih rib, glavonožcev, rakov in/ali školjk ter količina vzrejenih belih rib in školjk.

Ribe delimo po načinu ulova in okolju, v katerem živijo, v dve podskupini, na plave in bele ribe:

Plave (drobne pelagične) ribe lovijo ribiči z večjimi plovili na odprttem morju in so posebno pomembne za industrijsko predelavo (konzerve); prevladujejo sardeli.

Bele (pridnene ali bentonske) ribe lovijo ribiči z manjšimi plovili in pridnenimi (talnimi) mrežami v bližini obale; najpogosteje so moli in ciplji.

Indeksi mase ulovljenih morskih živali veljajo za tiste, ki so jih ribiči ulovili v opazovanem mesecu.

METHODOLOGICAL EXPLANATIONS

Purpose of the survey

On the basis of collected data we show the monthly marine catch and mariculture. Reports cover 66 types of pelagic and demersal fishes and about 10 types of cephalopods, crustaceans, shells and snails fishermen catch in Slovene and international waters and five types of fish and shells breed at breeding sites.

Observation units

are enterprises and companies dealing with catch and breeding of marine fish and shells and registered private fishermen whose main or supplementary activity is fishing. If a few fishermen catch together using the same fishing vessels, they are considered as one observation unit.

Data source

Data on catch and breeding of marine fish, cephalopods, crustaceans and shells are collected with monthly reports on marine fishing filled in by enterprises, companies and private fishermen registered in economic activity of catching or breeding marine animals.

Definitions

Marine fishing is an economic activity of catching marine animals.

Mariculture is an economic activity of breeding marine animals.

Catch of marine animals shows the quantity of unloaded fish, cephalopods, crustaceans and/or shells and the quantity of removed mariculture.

Fish are divided by the method of fishing and the environment in which they live into two subgroups, pelagic and demersal fishes.

Pelagic fishes, European pilchard prevailing, are fished with bigger vessels on the open sea and are especially important for manufacturing (tins).

Demersal fishes which fishermen catch with smaller vessels and ground nets near the coast; European hake and mullets are most common.

Indices of caught marine animals represent animals caught in the observed month.
